BTW, if one did elect to emulate the 6502 with another chip, I would vote for one of the ARM series, such as is used in 3DO and the Acorn Archimedes and RISC PC machines. Aside from low cost, low power consumption, and decently high speed, is is likely the closest to the 6502 in architecture. Indeed, the first emulator written for the arm was by Acorn, to run software intended for their older 6502-based BBC computers.

In a message dated 8-8-94, Glenn Saunders said:

"Something like a 25mhz Amiga could probably do a better job.
I'll be curious to see benchmarks on the XL/XE emulation
on the Emplant if they ever do it."

If by 25Mhz, you mean a A4000/040, I imagine it would be like a
turbocharged 8-bit. <grin>

Seriously, from what I understand, the A64 v3.0 emulator for the
Amiga is apparently on par with the 64's speed while running on an
Amiga 1200, which uses a 14.32Mhz 68EC020. While the 64's CPU speed
is close to half that of the Atari 8-bits, the custom chip emulation
should not penalize speed much further on the Amiga. The reason for
this is that while the Amiga's custom chips are likely untapped for
most of the 64 emulation, they would come into their own when emulating
their ancestors.

"With that being said, even if you can break the barrier
and have an 8mhz 65816, the custom chips must still run
at 1.79mhz so you've got the start of an ISA bus kind of
problem where the video is holding back the throughput so
you won't get full 8mhz throughput in most cases."

The difference here is that the chipset in the Atari 8-bit is static.
It is a sure bet they are not going to evolve to a point where they
require any more bandwith than now. No matter how high the CPU speed, the
8Mhz ISA bus was not much of a bottleneck with the original CGA and MDA
cards, because you were only pushing around a maximum of 16K of data.
Only when you expand this to the heady heights of todays resolutions,
where the data handled is hundreds of kilobytes per screen, and you start
to feel choked.

However, since the Atari 8-bit's video chips will never use more
memory than they do now, there seems to be little lost. The big plus
would be in having an expanse of RAM where a faster CPU could go full
blast for accessing RAM, and possibly a secondary high-speed bus for
faster peripherials than can be handled via the SIO or PBI. (However,
about the only thing we have now that is "limited" by PBI speed are
hard disk drives).

I prefer to look at the situation much like the chip RAM/fast RAM
setup on the Amiga, with the RAM seen by the ANTIC chip, and limited
to 1.79Mhz as the "chip" RAM, and the RAM seen only by the 65816, and
accessed at full speed, as the "fast" RAM.

Of course, one could design a processor that would cache reads and writes to "chip" RAM, to give a bigger speed boost to programs that made little or no use of "fast" RAM, but frankly, I think the expense (R&D cost) would be more than it would be worth.

Hello Atari net gods!
I need some help that I hope you guys out there in cyberspace can provide.
I just found an Atari 600xl, a 1050 disk drive, and a 1010 tape drive at
a garage sale for five bucks. It's a cute little computer, but I know next
to NOTHING about ataris. I would appreciate some help or comments from
Atari users out there on what I should do. I would also appreciate it if
someone would tell me where I can get a DOS disk (any sort) that will
work with this ancient disk drive.
Thanks,

I had this game! Very nice, especially when you shot oncoming
fighters - they sort of spun out of control. Not really as good
as Star Raiders though .. It didn't have that classic feel and
certainly wasn't in the same vein.

There may be a PC version. I know there is an Amiga version of
'The City' as I have it. I don't think 'The Dungeon' made it off
of 8-bit machines though :-(

4603. Assorted Atari Stuff For Sale

Newsgroup: comp.sys.atari.8bit
Date: 1994-08-09 16:48:03 UTC
From: prefect@bigwpi.WPI.EDU
Message-ID: <PREFECT.94Aug9124803@bigwpi.WPI.EDU>
Source record: 99136

Here's a partial listing of some assorted Atari stuff I have for sale (the major highlights anyway)

Atari 130XE (stock)

Atari 800XL board (socketed), pretty mangled case.. Board still works great.

Atari XF551 360K drive (stock, used about a month before I got my first PC)

Atari 1027 LQ printer

Atari 850 interface (I think I have 2 kicking around, it's been a while)

Atari SX212 modems (1 dead, 1 semi functional (as functional as they got))

ComputerEyes video digitizer, with gr.9 software (used for a month)

SpartaDOS X cartridge (another one I had for a month before I went PC)

Atari 1050 drive (rough shape, but it still works)

"your atari comes alive" book.. kinda interesting for hardware hacker weenies like myself.. a little basic, but useful nonetheless.

TONS of books, cables, disks, misc. parts, joysticks, etc, etc, etc.. (too numerous to list -- email me if you want a complete listing of everything)

If you're interested, send me mail.. If the price is right, I'll sell.. Otherwise I'll keep the stuff hanging around and play with SIO2PC one of these days... I'd really *like* to sell everything as a unit, but it's not mandatory I guess... make me an offer.

Thanks,
Steve

(Kamaro Kid says he leaves MIO on when plug/unplug printer cable.)
Ok, I looked in my MIO docs, 850 doc, and a few other places and could not find a warning to turn off things before plugging/unplugging cables.
I guess it comes from a long time ago. I used to do that (unplug/plug with power up.) I dunno. I think I ruined a printer interface or something. You can cause a short between pins because some of those pins have power to them. I also think you can get strange OS stuff happening, like I remember lock-ups and screens full of garbage.
I know all I have to do is turn off my modem while the disk is accessing and I get a lock up. I guess it is all a little hokus pokus to me, but like Mike or R. Dell or somebody could say if I'm just superstitious or whether there is a basis for my belief.

4609. German FidoNet

Newsgroup: comp.sys.atari.8bit
Date: 1994-08-09 21:54:32 UTC
From: REASERRL@POST2.LAAFB.AF.MIL
Message-ID: <2E479C4D@POST0.LAAFB.AF.MIL>
Source record: 99135

A little while ago, Guido Lehwalder asked about possible Atari 8-bit echo feeds in Germany. A quick search of the FidoNet Nodelist using the keyword "Germany" yielded the following:

LEGEND: Node Number, BBS Name, Phone Number, Baud Rate, SysOp Name, Location

2:3824/1, Zonegate Eur NorthAm, 49-431-338087 9600, Jens Mueller, Germany
2:3824/3, Zonegate Eur Aust, 49-431-338087 9600, Jens Mueller, Germany
2:3824/4, Zonegate Eur LatinAm, 49-431-338087 9600, Jens Mueller, Germany
2:24/24, Euro Star, 49-431-338087 9600, Jens Mueller, Germany
2:24/244, BitNet Gate, 49-6128-45411 9600, Frank Koehler, Germany
2:24/777, TipTop Germany, 49-69-7073131 9600, Klaus Wietrzichowski, Frankfurt
2:24/999, I/O-Gate Germany, 49-69-779022 9600, Klaus Wietrzichowski, GER
2:241/0, NDS/HB-NET, 49-511-5419912 9600, Peter Rohde, Germany
2:245/0, RHEINLAND-PFALZ NET, 49-6841-12767 9600, Werner Cappel, Germany
2:246/0, United Network of Germany, 49-7472-21034 9600, Volker Imre, Germany

It looks like Jens Mueller would be a good person to call, since everything going in and out of the country appears to go through him. I could probably do a search on "49-" and get all the FidoNet BBSes in Germany if that would be useful. I have to make a long distance call from California to Florida when I do this. James Baker who runs 221B Baker Street BBS has a neat online tool that lets you sort through the latest and greatest FidoNet Nodelist. Where does Guido live and what is his phone number. If I did a search on his "city/area code" I could get a manageable list put together. I think there are a gazillion Fido BBSes in Germany. I started to get the whole European list and gave up after I nearly filled my harddrive with just the ones in Scandinavia.

This BBS (in France, I think) actually is on the Atari 8-bit Echo now and several posts have come from it. You might check with Bertil on leads.

2:203/22, STraight BBS, 46-31-363973, 9600, Bertil Jagard, Partille

I've seen some of the more recent 65816 data. I also recently purchased an Apple IIGS accelerator that runs at 5+ MHz. The latest versions of the 65816 run at 10 MHz I believe & compare favorably with the 8 MHz 68000 & 8 MHz 80286. For the last couple of months I've been fooling around with the 8 bits clock, it seems like the final top speed for an 800 may be somewhere around 2-2.5 MHz. 2 is in the bank, 2.5 I'm not sure about & 5 crashes the computer badly with the 120 nsec dram I've got in my machine. I'm not sure if this is the dram or most likely the support chips. BTW: When I said 5 MHz I meant crystal or 2.5 MHz system clock. From what I've heard, the benefits of only a 12% to <50% increase in clock rate leaves most people under whelmed. I'm not doing anything with the Antic refresh rate so the screen should be able to do interlaced modes without as much flicker, but since the clock rate is changed, all the sio etcetera is different so timming for things like telecommunications would not work without a major rewrite. To get a 65816 up to speed it's going to need cache ram which is beyond my limited abilities.
/s

>other words, would an updated Atari 800 series machine be better off
>with a 65816 or a faster chip with on-board 6502 emulation?

The 65816 can go to 16 MHz I think. I know 8 MHz for sure. Existing 65816 designs may have been influenced by either costs, or by late availability of faster chips. But it will definitely go faster.

The 65816 chip is also potentially quite a bit faster than the 6502 at the same clock speed. Moving memory is over twice as fast. Good use of the 16 bit registers can make code twice as fast also. Other addressing modes and instructions can improve both code speed and size. Most importantly, the 65816 can address up to 16 Megs of linear addressed RAM. All of these things would make significant improvements to an Atari, but would have to be programmed specifically.

Applications heavily dependant on memory moves, such as a text editor, can very likely be patched with the 65816 block move instruction with very little effort. A 2x speed increase is very likely.

Other than that simple example, running existing 8 bit software at a faster speed is a difficult problem. While an 816 CPU might easily run at 8 MHz, the custom Atari chips are still going to have to run at 1.79, creating a dual-speed machine where you will only get the fast speed when using memory outside the base 64K where the custom chips reside. Much like the chip RAM and fast RAM architecture in the Amiga. Since most existing 8 bit applications would run in the 64K 'slow' section of memory, they would not take advantage of the faster CPU.

The way around that, as I understand it, is to redesign the Atari custom chips so that they can run at a faster clock speed. While this creates lots of incredible possibilities, the costs, time, difficulty, and feasibility of such an exercise would be prohibitive.

Anybody happen to have the schematics of the ANTIC etc. chips handy? :-)
That would shorten the development cycle tremendously.

John Harris - jharris@cup.portal.com

Getting more throughput out of ANTIC/GTIA is beneficial. It has been stated that their speed suits their reslutions. Not really the case entirely. Faster blitting could facilitate polygon animation for one thing. And more color stuffing per screen approaching that of Hold And Modify. So although I think it is unlikely that ANTIC/GTIA can be overdriven or that they will get a formal update, it WOULD have been worthwhile. No graphics mode takes more than 8K of RAM. By the time the 130XE came out, these restrictions were meaningless. A host of additional color depth resolutions would have been possible because there was more than enough RAM to spare. A mode that takes up to 64K would have been possible by using ANTIC banking and dumping screen memory to all 4 banks and have it go through a standard screen cycle reading through the entire 64K leaving all of the main 64K available for CPU code. That is the great magic of ANtic banking, that you essentially get a separate video ram area. But Atari didn't try getting a hardware 80 collumn mode or 320x192x16 GTIA modes or anything. So even within the 64K 1.79mhz limit there was room for expanding what ANTIC/GTIA could generate.

4615. Re: What about multi-coloured graphics?

Newsgroup: comp.sys.atari.8bit

One of the benefits of the Atari 8bit was its many text modes. In fact, ANY bitmap mode could be used as if it were a text mode for fast animation using redefined character sets. This was used to good effect in Ballblazer.

The flexibility of the myriad of graphics modes and the dli tricks with the Atari far outweigh the superficial specifications of the individual vanilla modes. But many C= and Apple lovers bring up the 16 vs 4 or 1.5 color depth issue in bitmap/text modes. It's just not that easy to compare 16 FIXED colors with 1.5, 2, 4, 16 hue/shade resolutions from a 128 or 256 color palette. .GIF files demonstrate the benefits of PALETTED fewer colors per screen vs. FIXED colors to use.

(Bry asks about feasability of upgrading a 256k mio to 1 meg.)
I think such an upgrade is quite more than trivial. The drams are
special and other differences. The question is a bit moot since the
thing to do is wait for FTe's catalog and see what kind of upgrade deal
you can get for your 256k mio. The new mios are gonna have 80 col.,
like FAST 80 col. and other improvements, if I'm not mistaken.

The Suburban Chicago ATarians (SCAT) user group will hold its August meeting on Tues. Aug. 16 at 7:30 PM (7PM setup), at the College of DuPage, Room K157 (the K building is located on 22nd St. just west of Lambert Rd., in Glen Ellyn). The scheduled demos are: 8-bit: SynFile; ST/TT/Falcon: Tentatively, CD-ROM on a Falcon.

Everyone is welcome to attend.

For more information, send me E-Mail at one of the addresses below, or call SCAT's Graceland North BBS at (708) 545-2554 and leave Mark Biallas or me a message. [If this article shows up outside the greater Chicago area, I apologize - the "chi" distribution may not work (at all sites) now. Say, if you're travelling to the Chicago area and will be free that evening, feel free to stop by!]

Nick DiMasi, SCAT President

I use an Acorn A5000 and I would love to emulate an atari on it. The 6502 emulation is indeed very good but I don't know if there is enough processor speed left to emulate the custom chips. Does anyone have sources for the chip emulation?
Without those I would need all the documentation on the chips. Some parts of the rom would need a rewrite to handle IO.

- Eddy

There is/was an IBM version of The City. I haven't been able to
find The Dungeon, however (it doesn't exist?)... Several key points
about the 16-bit version (IBM) vs. the Atari 8-bit:
1: The graphics aren't as nice. (They COULD have been though!!) They
are using either CGA or EGA (CGA is 4 color, so we'll forget that
for the moment)... In EGA, the sky never changes colors (day turning
to night) the sun is a bla white circle in a field of cyan.. I've
never gotten the good day changing like I have on the Atari..
2: Though the text to the songs played in the taverns ARE in the .EXE's,
you never ever see them... and of course there aren't any music in
the taverns (there could have been)
3: In the IBM version you can join GUILDS and learn and cast spells..
Certain stats have to be a certain level AND they have to be
"accepting applications at this time".. :)

Looking back through my old AR news letters, it seems that The City
came out about the same time that The Dungeon came out for the 8-bits.
(Sept. '86 or so?) It seemed, according to the newsletters that it
was a very well loved game, and lots of people were playing it...
Go figure. I think EA owns it now, and then killed it. (In favor
of Bards Tale?)

Ah well..

4623. HELP! Hooking up 2 1050s

Newsgroup: comp.sys.atari.8bit
Date: 1994-08-10 19:58:34 UTC
From: sydtech@winternet.com
Message-ID: <32bbha$rra@blackice.winternet.com>
Source record: 99006

I just got another 1050 today, and am having a bit of a problem....

The drive works just fine by itself - boots up, reads/writes, etc. The problem is trying to get it to work with my current 1050 drive. I've tried every combination of disk select settings and cables, and I just can't get the thing to work properly as a second disk drive. I even tried making it the master boot drive and my current 1050 the second drive, and that doesn't work either. Try to get a directory from DOS and I get an error 38. Try the same thing from inside 850 Express and I get the same thing...

Is there some trick or specific combination of things I have to do to set this up properly?

Thanks...
Scott (who's never had more than 1 drive on his 8 bit!)

4625. HELP: XEGS Cart Slot Failure

Newsgroup: comp.sys.atari.8bit
Date: 1994-08-10 22:34:44 UTC
From: sydtech@winternet.com
Message-ID: <32bkm4$sst@blackice.winternet.com>
Source record: 99014
Cross-posted to: comp.sys.atari.8bit,rec.games.video.classic

I picked up one of these at a thrift shop recently, and it works fine, except for one annoying problem: the cartridge slot doesn't work! Everything else on the thing seems to work, including the built in BASIC, the built in Missile Command, and booting from a 1050 drive.

I took it apart and looked carefully at the slot. Besides tightening up the contacts a little bit, there's nothing visibly wrong with it - all the solder points seem to be in place...

I'm looking for suggestions on what else to look into - I hate to let a good piece of classic equipment go to waste!

Thanks.....Scott

WOW! The thing sounds INCREDIBLE! HOW did they pump 8.25khz out of the Atari doing that type of sound!? Yikes! :) I know a few folks in Atari sound who'd be quite interested in hearing this I'm sure (like Glenn Sauders, for example)

Where can I get a MOD -> MD8 converter!?

Are the folks who made Fampy on Internet? I know the creator of MODPlay 1.22 is.

Thanx!

If you have no disks at all, the best thing to do would be to find the local Atari user group (if there is one in the area) and pick up a copy of DOS 2.5. If that isn't possible, I know that my user group would probably mail one out for around $3 or so. That should cover postage, disk and envelope.

The 600xl is a bit of a oddball. It only has 16K but can be easily upgraded to 64K. The upgrade takes 3 pieces of wire and 2 memory chips which can be bought for around $2.50 each. I have plans around here somewhere that describe how to do it. I could probably include them in with the copy of DOS 2.5. There is a minor amount of soldering involved and you have to pull a pin or two out of a socket. Other than that, it's about a 30 minute job.

I know that there is a user group in the Alamo area, and I think one in Houston as well.

I know this demo is four years old but I'll say it anyway. I found that when the Gnome demo was being loaded and I held down START (it would then blink twice while skipping the two gnome demo parts) and I'd see three demos which I hadn't seen before..One was REALLY cool (cuz I love dots!). Why doesn't anyone do dot tunnels on the atari?

4633. AC: Final Farewell

Newsgroup: comp.sys.atari.8bit
Date: 1994-08-11 03:00:35 UTC
From: b.poehland@genie.geis.com
Message-ID: <199408110259.AA164763989@relay2.geis.com>
Source record: 99153

ATARI CLASSICS: Final Farewell August 10, 1994

It pleases me greatly to report that the issuing of refunds to all former subscribers to the old AC is now essentially complete, and as of this date the original publication may be considered officially terminated.

I wish to officially announce my departure from the AC Staff, and hereby declare my resignation therefrom in the positions I occupied, Managing Editor and Circulation Editor.

The status of refunds at this time is as follows:
1.) A batch of 88 refund checks, representing the last of the American refunds and all of the Canadian refunds, was posted on August 9 and should be in the hands of their intended recipients shortly.
2.) A batch of 18 IPMOs and bank drafts, representing refunds to overseas subscribers, was posted today. The IPMOs will take a few weeks for postal processing before final delivery.
3.) Unicorn Publications is presently working up 17 credit card refunds to overseas subscribers. Notices of account credits will be mailed out shortly by Unicorn Publications from Ann Arbor, Michigan.

All together, a total of 351 refunds has been/are being issued. The refund policy as announced in the April AC was followed very nearly as given, except in the case of Australian refunds: one Australian refund was denied and the remainder made by bank draft, in consequence of the discovery that IPMOs are not available to Australia.

The entire stock of back issues of the old AC has been transferred to the magazine's new management in California, including back issues of the AC Software Disk. I will no longer respond to inquiries concerning back issues or subscriptions to AC. Individuals desiring such information about the new AC should contact:

ATARI CLASSICS Magazine
5507 Langford Court
Concord, CA 94521
ATTN: Jim Hood, Managing Editor

A number of people have asked what role I will play in the new AC. I've made myself available to the new management in a consulting/support capacity over the past 6 months and expect to continue in that role for as long as they desire my services. Many people have begged me to continue my "Alchemist" column in the new AC, but regrettably circumstances will not permit me to make contributions of that nature in the forseeable future.

In consequence of unprecedented instability now sweeping the U.S. pharmaceutical industry in the wake of political turmoil surrounding the

Clinton national health plan proposals, many scientists in that industry are experiencing the loss of their jobs and wreckage of their careers. I am one of them. In June the department where I worked for 13 years was abolished, and I became unemployed. A few weeks later I received news that my mother has been diagnosed with terminal cancer. In a few days I'll be leaving for an extended visit to Mesa, Arizona to attend my mother's needs. I trust the 8-bit community will forgive me for placing these serious concerns far above any continued participation in Atari magazines. However, I anticipate being an 8-bit user for quite some time to come, and of course I'm a charter subscriber to the new AC.

The slow pace of refunds over the summer on the part of Unicorn Publications initially hobbled the efforts of our California colleagues to restart the magazine. Many loyal readers apparently held off subscribing to the new AC until they had received their refund from the old AC. By encouraging Unicorn to complete the refund process in a timely manner I expect to see a corresponding boost in support for the new AC in the weeks ahead. Feedback I've received from readers in response to the refund program has consisted mainly of expressions of astonishment that the policies stated in the April issue were actually followed and people had a cash refund in hand from an Atari magazine for the first time in the history of Atari computers. I'm very proud of the legacy AC established in dealing "up-front" with its loyal supporters and hope the new management will continue the tradition.

I don't have any real figures for the present level of support for the new AC, but reasonable estimates place it at around 200 paid subscriptions. Based on my experience I believe the revived publication will probably top out with a subscriber base in the range of 300-350. Unpublished manuscripts remaining in my hands were turned over to the new management following their promise to continue the same policies toward author compensation that I originally established. Recently they've begun aggressively recruiting a staff, and I'm pleased to report many of the former AC Staff will be serving the new publisher. I'm also aware the new management has been in contact with Unicorn Publications to secure transfer of the magazine's 2nd Class mailing permit. They've also made local arrangements that will permit them to print the new AC far more cheaply than Unicorn did, which means they'll be able to survive financially with a smaller subscriber base. All indications point to a revival of AC very soon, I would guess September but must admit that's purely speculative.

Finally, many people have questioned why it was necessary to shut down AC and start it up anew instead of just having the old publisher turn over operations to the new. First, I must point out that plans to shut down AC had already been laid in January 1994, well before Bob Woolley became actively involved in saving the magazine and securing a new publisher. Once the presses began to roll it was too late to stop the process; the best I could do was extend support to the new effort. Second, back in February no one knew what level of support a revived AC might attain. Staff morale was extremely low due to the sharp falloff in renewals in Dec.'93/Jan.'94, and even Bob Woolley and Jim Hood were concerned there might not be enough support to warrant their continuing the effort. The whole period of January-May 1994 was fraught with

unknowns, anxiety, chaos, and instability-- punctuated by power blackouts and disruptions caused by the Killer Winter of '94 (which left me with $2,000 in property damage and a huge mess to clean up). For Unicorn to turn over AC to an unknown third party in such a climate would have been an act of catastrophic stupidity. Due to the uncertainty of future support, Bob Woolley and I mutually agreed any continuation of AC would have to be an independent effort. And finally, neither the Staff nor Publisher of AC had the authority to transfer the magazine's operations even under ideal conditions. Had AC been threatened by some external event (for example, the collapse of its publisher), it would have been within the scope of my authority to transfer the operation elsewhere. But instead, AC was threatened by a failure of support from the very community that brought it into existence. In conferring with Jeff McWilliams (de facto representative of the 615 people whose response to the mail campaign of 1992 authorized him to ask me to start the magazine), we agreed that in view of the situation the correct response was to "give AC back" to the community that authorized its existence. The only way to do that was to release the Staff back to the community and distribute the magazine's financial resources back to the community. We have in effect given AC back to the community from whence it sprang, in consequence of the community's failure to support the original mandate.

People should bear in mind that the revival of AC in California is totally independent of the original AC. All the support given by elements of the old publication to the new have been at a purely personal level, none of it official. For the past 8 months I've walked a fine line between strict adherence to the original proposals upon which AC was founded and my own personal desire to see the AC Experiment live on. Through the intervention of Bob Woolley and a mutual spirit of informal cooperation between elements of the old and new publications, I believe I can at last claim success on both accounts. We have been through a trial by fire, from whence a new AC will arise as a Phoenix from the flames.

For some of you, the refund you receive(d) is merely a check, to be cashed and spent. But for others- those of you still capable of dreaming- that refund check is a ticket to be used to vote yet a second time to continue what still stands as one of the most unique events in the history of personal computers. I hope people will realize the extraordinary effort that has gone into giving the community a second chance to vote, and that you will do so wisely.

Respectfully submitted,

Benjamin L. Poehland

>Amiga Emplant is using the "precompile on the fly" technique for Intel
>emuation. This first pass is the trick for getting amazing throughput
>compared to emulating the CPU realtime. Same could be done with older
>CPUs for throughput that would blow the doors off of PCXformer.

One of the things that makes this EMPLANT trick possible, I believe, is the way file formats on all newer machines are designed to be relocatable. The object file itself contains all of the locations of any addresses used in the program, so that they can be relocated when the program is loaded. Without this information, it wouldn't be possible to distinguish immediate data from addresses, and precompiling couldn't be done accurately. Much the same problem as creating source code from a disassembler.

I also expect a lot of compatability problems with the code translation approach, and EMPLANT is going to have an interpretted mode to fall back on.

A 6-8 MHz 65816 is extremely fast. Many times faster than an Intel CPU at the same clock speed. It's more than fast enough if applications are written for its native mode.

Another neat thing about the 65816, is that it is the only 8-bit to 16-bit evolution where code on the 16-bit machine will wind up smaller, all other things being equal. It's a really efficient implementation.

>to NTSC compatibility, it could be run faster (with modification) and used
>to drive RGB screens instead. I agree that by the 130XE, there should have
>been SOME change to the graphics modes.

The Amiga is a good example of what can be accomplished, without breaking away from the NTSC scan rates. The first models were capable of 16 colors in 640x200 resolution. Current models display up to 256 colors at 1280x200. (Or 400 vertical using interlace, or 262,000 colors using HAM). All of this can be output directly to NTSC, and while you could never distinguish individual dots at that res, it's great for generating characters with very little staircasing effect. Plus the colors let you anti-alias to smooth the characters even further.

That being said, an ANTIC/GTIA at twice the bandwidth would be able to do 2 colors at 640x200, 4 colors at 320x200, 16 colors at 160x200, and also 4 color players. That would be pretty useful, and not make a major impact on RAM speeds and costs. I wish Atari would have done it.

Basically, the Amiga chipset is operating at 8 times the bandwidth of the Atari 8 bit chips. The new ones at 4 times faster than that.

Ben,

I sincerely wish you strength in your situation, and I appreciate all you have selflessly given to such niche audiences as we. Without your efforts, many of us would be living with senseless design mistakes made ages ago, and we certainly would not have the understanding of our chosen machines that we have now. I regret that I did not take advantage of AC! the first time, and as I watch the computer industry lose its personality on a day by day basis, I appreciate what supporting such efforts are truly worth.

My prayers are with you.

Oh, you folks wanted 3d star destroyers!? Check out the 3d polygon
stuff in Intel Demo side A! F'ING >> AWESOME! <<

Anyways, I had much trouble before with the thing, but now I found that if you
boot up a copy of Chaos Loader (I got a copy of it and CHINIT on a KESoft demo
disk mailed to me a while ago) and then insert the Intel A disk and select one
of the IBM-filenames (CONFIG.SYS, IBMBIO.SYS, AUTOEXEC.BAT, etc..) I hadn't
noticed those last time, but those are the actual files of the demo! Can't
load it from DOS but hell, Chaos Loader stays resident (just do RESET back to
it) and takes nil time to boot! (the code is IN the boot sector! NICE!)

Anyways.. man I almost died when I saw some of this stuff! YEEEOW!

Ok I shut up now and get back to work :)

For those of us who are 'hardware challenged' B&C Computervisions lists
a plug-in upgrade for the 600XL for under $20. My latest catalog is
2 years old, but I think they are still in business. They are in
California and their phone # is (408) 986-9960.

To those who have seen this wonderful demo, how can I get past the big dot plane (1500 or so dots?)??? I can't hit space or anything! Wouldn't you know it? A demo that promisses PLASMA and other stuff (kinda like Cool Emotion promissed all that good stuff) and I can't load it! bah! At least the sound on the back is cool (good thing I have a USD now!)...

(Followup to my own msg. re- xegs cart. slot.)
You probably already inspected the cart contacts and the slot contacts.
But just in case, a little more. You can use an eraser or emory type
sandpaper on the cart. For the slot contacts, a point of a knife or a
metal fingernail file, cut square on the end if you have to, would
work. Then give a blast of air to blow out the filings. I think the
contacts are gold on my 800xl cart. slot, which means very little
scraping should be done or use a pretty soft cleaner.

Try cleaning it. Break apart a SNES, Genesis or NES system cleaning kit
piece, and cut it to fit the slot. Do this about 50 times and then try
a cartridge. If it still doesn't work, try again. You can clean the
system cleaner piece with an eraser.

This also works for every other classic system I've seen, it just needs to
be cut to the right size.

Wes Newell can be reached directly on the FIDONET on the international ATARI 8-bit echomail message base called -- simply -- "ATARI". His FIDONET e-mail address is located in Wylie Texas and he participates in the ATARI FIDONET Echomail message base. I'm sure that he could "matrix netmail" you specific answers to any of your inquiries (although I do not speak for Wes.)

P.S. If someone else would like to post a FIDONET e-mail node address, so much the better, but I do not know it off of the top of my head....

: : the same thing...
: Er, that was supposed to be an error 138....

That would be device timeout (no drive found) according to SpartaDOS and it is probably the same back to Atari DOS, the settings on a 1050 for drive one are you should see only black on the left (the white switch should be behind the black and both should be all the way to the left). For drive two it is: white should be on the left, black on the right. It might be a bad SIO port, try changing your connections, if it is your original drive then make it two and don't use the SIO port that you were trying to chain another drive to, that might be the problem. But you might be simply making a mistake with drive switches.

I believe it will work with an Adaptec ADB4000 series (4000,4000a,4010) that
has been wired for SASI. I have the ADB4000 manual, and if I recall
correctly, the info on how to do that is in there.

As I originally posted this, I have contemplated formatting with the ACB400A
configured for SCSI on a Sun. Then change the ACB4000A to SASI (and pray
it doesn't need to be reformated when you make that change), and then it
would be low level formatted and I could use it on my Atari. I prefer not to
do this, as I do not want to be changing board configuration (and it's not
just a jumper change as I recall), and having to use another computer in
order to low level format a hard disk for my atari).

Well, I've begged and begged and begged.... and it has proved reasonably
fruitless..... I have had one response saying that they know an Atari
HD guru, and if he knows anything, he will e-mail me.

If I do figure out and obtain the formatting programs, I will post to the
group for the benefit of the group..... and quite possibly upload to the
Atari archive.....

4657. SIO2PC format question

Newsgroup: comp.sys.atari.8bit
Date: 1994-08-11 22:42:36 UTC
From: feb6399@ultb.isc.rit.edu
Message-ID: <1994Aug11.224236.11821@ultb.isc.rit.edu>
Source record: 99032

I have a quick question about the SIO2PC disk image format,
for whoever knows the answer for sure.

I've heard of a small conflict on double density (secsize=256)
disk images, dealing with the first three sectors. I know that
on the real disks, they are stored as single density.
Now, in the SIO2PC format, are those three sectors padded to
256 bytes, so that the start of any sector can be found with:
ofs = 16+((sec-1)*256)
as an offset into the SIO2PC file,
or are they stored as only 128 bytes each, so that you have to
do:
if(sec < 4)
ofs = 16+((sec-1)*128;
else
ofs = 16+128*3+((sec-4)*256)

I've been using the first method (the simpler one, even though
it wastes 384 bytes) but will gladly switch to the second method
for compatibility if that's what is currently used. Does
anyone happen to know?

(I've heard of XF2 having a problem with this for SIO2PC....
does anyone also know which way XF2 does it?)

: I was wondering, what is the difference between using a RAMBO and a 130XE
: when it comes to bank switching? Is RAMBO capable of banking differently
: for Antic and the 6502 like Freddie?

The Freddie allows banked memory to be split so that ANTIC can see an independent memory bank from the CPU. This allows you the freedom to move screen memory outside of the main 64K. This is a great boon for programmers if they ever used it. They'd gain a good 8K or so of usable memory this way. The Newell simulates the Freddie I think, but the RAMBO is a dummy upgrade. The problem with hacks like Newell and Rambo and such is not that it's hard to mimick the Freddie and Antic banking, it's that you only have a handful of bits for bank addressing and the only way to get to big upgrades is to move away from the XE-banking model and stick to "vanilla banking".

I proposed using a 2nd PIA because you would have a full 8-bits to play with outside of PORTB but the problem is that no software can see it so a fallback to PORTB up to the maximum without ruining XE compatibility is still necessary and this creates a complexity for the hardware and the potential RAMDISk handlers to use 2 different addresses simultaneously.

Somehow FTE worked around this problem.

It was really Atari's screw up. Atari could have made a 2nd PIA standard on the XE's and map it right into the motherboard and we wouldn't have had this problem.

But by 1985 the Bucholz/Rambo was already defining a banked-ram standard and Atari followed their technique rather than looking at the problem with bit addressing with larger upgrades.

4659. Atari Reference Card (sorry, not yet)

Wow, an Acorn user! Being in the US, I've never even seen one (though
I've heard they are quite fast). I wrote a 6502 emulator for the Atari
Falcon030, but could not get decent speed out of it. I tried some DSP
coding to make it faster, but the whole thing got too complicated. The
custom chips are best documented by Atari's 400/800 hardware manual, and
the book "De Re Atari". You will need a decent chunk 'o code just to
convert Display List driven video into a bitmap. I'm considering
different ways to emulate hardware acurately so that all games will run,
but I have not actually started this project again (maybe on a 486 this
time, yeah, I know they SUCK to program). The trick to a successful
emulator is one that keeps count of the number of 6502 instructions it
has done per VBL so it can attempt to account for hardware tricks.

A software-only alternative is UTIL available at the UMICH archive. If you
have a double density capable drive on the Atari (Indus, XF551, Rana,
etc.) and a 5 1/4 drive on your PC, you're in business. Just copy
your Atari files onto a true Double Density (180K) diskette formatted
with MYDOS. Pop the diskette into your PC, run UTIL and the files
will be transferred perfectly onto your hard disk. The instructions
that come with UTIL on the UMICH archive are rather sketchy, but
adequate. If you need further instructions, contact me via EMAIL.

From: khaley@nova.gmi.edu
Message-ID: <khaley.776694161@nova>
Source record: 99033

I recently tried out Darek Mihocka's PCXformer 8bit emulation software on my 486, and I must say I was very impressed. I have the public domain version 2.0, and I have a few questions on 3.0 and SIO2PC.

In the docs for PCXformer 2.0, it states 3.0 will be out soon and will support sound, P/M collision detection, and joystick support. Is this version out yet? Did anyone get it or try it out? And if so, how well does it work?

Also, where can I get info on setting up an SIO2PC connection between my old 130XE and 486? I have tons of software for my old XE, and now that I have seen a good emulator for the PC line, I'd like to port some of it over. But I need the docs and instructions (as well as necessary programs) to accomplish this. If anyone can direct me to the right place to obtain these things, that would be greatly appreciated.

Thanks in advance.

/Kevin

>
>Paul

Actually, now that I've got that little PSIOX (Parallel SIO Xfer) utility I wrote that makes ESIO2PC files (extended SIO2PC, with bad sector information) I was able to make ESIO2PC files of the alternate reality disks and boot it up under my emulator... Everything worked fine up until the nice 128-color gate scene where you pick your attributes, and then it locked up. It *did* however give me the correct display-- it just didn't change at all, and it didn't react to any keys.

I'll see if I can figure it out and fix it so it works (yes, I want to play it again too, just for nostalgia's sake) after I get the rest of the emulator ready for release. I'm integrating it with the PSIOX stuff and all my virtual device stuff.

Just for those who don't know-- for the past year, I've been trying to release my Atari 800/XL/XE emulator for X-Windows. (It'll compile on any machine with Unix, and run in text mode if you don't have X-Windows, or it'll work in SVGA mode on a PC running Linux, so it's fairly portable. Shouldn't be too tough to work under DOS either except that I don't have any good development tools under DOS, since I don't really use it)
It's not quite as fast as XF2, I must admit, since it's all in C, and made for portability, but it is far more compatible. (yes, it *does* do the collision detection for P/M graphics, and even some sound, although just through PC speakers right now, since that's all I've got)

As soon as I have it integrated with the other stuff I was doing, I'll release everything.

(and in the meantime, if anyone can send me the format for DiskComm, or any source code that deals with it, it would save me a ton of time and let me release this sooner, rather than reverse-engineering the format....)

Later...

Actually, like I said before, just get Chaos Loader or something, then tell it to load those IBM-mocking files: AUTOEXEC.BAT, IBMBIO.SYS, CONFIG.SYS, etc. I believe NC or NCMAIN is the 3d-poly demo, and whatever is after that is the final scroller (I know! not much!)

I was actually surprised that those files are the acutal programs, not just a dummy directory like in most demos.

Anyways, I can't get past that waving dot thing either (how much do you wanna bet that's just character bitmaps? It's SOO repetative :)) but if you boot with a tiny-loader you'll be able to skip it entirely and see the TRULY AWESOME stuff!!! :)

Where can one contact Our5oft? I have their address from their really small demo (the one that did three graphics modes per scanline and that ton of player/missles) but is that still current!?

Thanx!

Hi.. PC XFormer 3.0 isn't done yet, but I'm sure you'll like the docs (grin) cuz I'm writing them. I may actually ask Darek if I can publish a smaller version of it (with less emulator babble) for the rest of us 8bitters. It's becoming a simple little reference for newbies just like the FAQ I wrote, but not in an FAQ format (cuz that'd be sorta dumb for a manual :))...

Anyways, Darek is (last I heard, a few months back when I started the project of writing the docs) is on vacation. His last official release date for 3.0 was September, but I'm pessemistic, because I know how projects tend to take a bit longer. (esp. since I had to explain some of ColorView and Graphics 9 to him! :) hehe.. he's more of a 400/800'er than an XL/XE'r it seems!) But what do I know, like I said, I haven't talked to him in a LONG time.

What I CAN say though is, if 3.0 looks anything like the latest versions of the ST Xformer (so far as the interface) it's going to be one HELL of a program! :)

Good luck! Hey, what ever happened to the 130XEC (emulator card for PCs?)

from a quick look at the source code, its looks to
be the second method. afs & my s2pc file image util
agree. However, it looks like the image file size
is set as if the first 3 are 256 bytes. Hmmm.

4676. 800XL MPU pin numbering?

Newsgroup: comp.sys.atari.8bit
Date: 1994-08-13 01:40:50 UTC
From: vimx <vimx@delphi.com>
Message-ID: <x03SUJa.vimx@delphi.com>
Source record: 99047

I have a couple of atari XL boards. I would like to modify them to run with a different processor because I like the unique graphics capabilities of Atari, but not the 6502. The chip in the XL appears not to be a real 6502, because when I replace it with a real 6502 it does not work. I need to know the pinout so that I can replace it with a 6800-family part.

4677. Intel Demo and other stuff (MyDOS)

In a little bit I'm going to DCM up a small MyDOS 4.53/4 disk image and
put it on UMICH, as well as the following:

POLYDEMO.DCM - the very nice Polygon demo extracted out of the Intel Outside
demo
INTELA.DCM - the Intel Outside demo itself (I'll DL it straight from
the nova site and into the UMICH site)

And I may package up the INTELB if I can get all of my SIO2PC disk images
working PROPERLY.. but it seems that that is spreading around also (Phigan
(sp?) got it.. where from? nova.pvv site?) so I might not bother with it
too soon.

Anyways.. look for this junk up at UMICH soon!

OH! And look for an article by me in an upcoming _Current_Notes_!!! :)

I don't think you'll have much luck using a 6809 in the Atari 8-bit.
It's a curious notion but not likely. I mean, not only would you have to
try to make it work with the motherboard, you'd have to rewrite the
operating system ROM as well! If you want a better CPU try hacking on a
65816 like what has already been tried with some success.

It's not a stock 6502. It's called a 6502C and it has a different pinout
and an added halt/antic refresh system. This is done via "tri state
buffering" on the 400/800 which uses a stock 6502.

The Atari 7800 Prosystem uses the same CPU as the XL/XEs. Other than
that no other machine has ever used that flavor.

Lawrence used to be a member of the Louisville user group, AEL, but I
haven't seen him in quite some time. I don't know if he is still in the
area.

In any case, I have several hundred 8-bit files on the AEL BBS, The
Atari Scene. (502)-456-4292. 300-14.4K 24 hrs.

I've transferred most of the 8-bit files from my old 8-bit board onto the
ST. There are 3 8-bit areas, Utility/Application, Games/Entertainment
and Music/Pictures.

I haven't put the old Zmag issues back online since there was little
interest in downloading then.

Perhaps, but it has proven to be almost impossible to emulate correctly.
Emulating the 6502(7)? NO problem. Emulate TIA and get the whole thing
running at a smooth speed? Nope. That's why you hear people saying "Hey
d00dz! I'm gonna write a 2600 emulator for xxx" and then they disappear
never to be heard from again.

The same thing has happened with the Atari 8-bit until recently.

4684. 16bit sound conversion.. oops

Newsgroup: comp.sys.atari.8bit
Date: 1994-08-13 20:36:22 UTC
From: kendrick@zippy.sonoma.edu
Message-ID: <32jas6$fa@nic-nac.CSU.net>
Source record: 98960

UH OH! :)

I was thinking about this the other day (and just remembered), that converting a 16bit sound file into a 4bit Atari sound file isn't quite as easy as converting an 8bit sound file into a 4bit one.

Here's the quick, cheap, dirty, and easy way to do it, which is what I did with Convert4/8:

Read in the whole file.. everything! It doesn't care WHAT the file is!
It could be a text file for all it knows!
Write out the Parrot file header, including "00000" for the size.
Write out the data read in.. all of it, but in nybbles.. ie:
chop the top nybble off of two bytes and put the first byte as the high nybble in the new (outgoing) byte, and the second byte as the low nybble in the new byte. This in turn cuts the size of the new file in (about) one half the size of the original file.
Go back to where the "00000" size was written and write out the true size count (I don't remember if I just did an "open for read/write" and read in a certain number of bytes and started writing when I hit that position, or if I used a NOTE before I originally wrote out the "00000" and then a POINT to get me back to it.

That works fine for 8bit data because it's just that.. 8bit. Anything less is a bit difficult and the same for anything more (like 16bit).. I don't know where the chunks of information start! I could just do every other byte starting from the first byte, but then I might be picking up the wrong pieces of information. I might not have explained it correctly above, so let me try it again with a drawing:

You have a byte: 01011010 The top nybble (0101) is the "most significant" peice of the information. Hell, the
first BIT is THE most significant, but on the
Atari, we're dealing with nybbles for digital
sound, so we cut the 8bit bytes into nybbles
(and later stick them together to save space
and because that's how players like Parrot
deal with the sound).
The bottom nybble, (1010, on the right) is the "least significant" or at least "less significant" peice of the information... it's the 'detail' that 8bit sound players like a sound card on an IBM for example, gets to work with as well as that top 4bit. It's like on the Atari, we have 16 shades of grey, that's 4bits or a nybble. On the PC we'll PRETEND you get 256 (you really don't, but who cares here, right?) shades. That's 8bits or a whole byte. If we were to convert it, we'd simply divide the brightnss (0 to 255) of the PC's pixel by 16 to get it between 0 and 15.

It's not that th PC is 16 times brighter, but only 16 times more 'exact.'

Hmm.. I'm trying to make this make as much sense as possible and as cleanly as possible, so please bare with me if you don't get it. :)

Anyways.. now, on to the 16bit problem. In a 16bit file, we've got 4 nybbles to deal with.. But where to start? On an 8bit file every 8bit peice of information is stored within 8bits, one byte, which can be read in and dealt with accordingly. In the 16bit file, there are TWO bytes, and figuring out whether any one byte is the MOST significant byte (and the next byte is the 'detail') or the LEAST siginificant byte (and the PREVIOUS byte was the MOST significant of the two) is going to be a bit tricky.

I can't just make a program which cuts out every other byte because I may end up with a file which contains ONLY the LEAST significant peices of information, rather than the more USEFUL "MOST significant" peices.

Now, I'm not here complaining or saying "I'll never do it" or asking for "help!", but I guess I'm here to do two things:

1) get a little more >ACTION< in this newsgroup!
2) let you know that 16bit files are currently a no-no with my converter, unless you want to try cutting your files into two halves, one file being all of the odd data, the other being all of the even data, and then converting BOTH of those to 4-bit files and seeing which one worked properly.

I DO have a sound file FAQ but I have not yet looked at it and I don't know if it has ANY details on sound file formats. If it doesn't, THEN I'm stuck and I'm going to have to search for one. I know I've seen a lot of SUN users wanting "WAV->AU" converters on the alt.binaries.sounds.* groups, and a lot of PC users wanting "AU->WAV" converters, and a lot of Mac users wanting "WAV->SND" converters! :) I don't know if there's much hope for me other than getting a copy of some program called "Sox" for Unix (I think? or was it Sun?) and playing with it! Hehe!

Anyways, I hope you liked my little bit about the technical points of 16bit sound files and why I can't yet do them! :)

4685. Atari Classics

Newsgroup: comp.sys.atari.8bit
Date: 1994-08-13 22:12:05 UTC
From: eric.palm@drs.state.ct.us
Message-ID: <940813180717358@drs.state.ct.us>
Source record: 98957

Dear Mr. Poehland (sorry if I spelled your name wrong). I've read a lot about Atari Classics, but never subscribed, since I like many others have had bad luck with the likes of Antic, STart, and Analog. If there will be a good refund policy in effect for this new ownership, I should like to subscribe

Even though my 2 130XE's aren't my main computer any more. I still have a fascination and love for the Atari 8-bit. I have no particular fondness for my 486 like I do for the 8-bits of yesterday. Please mail me with subscription information.

Thank you

eric.palm@drs.state.ct.us

Atari 8-Bit Stuff for sale:

HARDWARE:

850 Interface with printer cable and modem cable, $50.

1010 cassette Recorder, $10.
(If you buy the cassette drive, you can have a box of over a dozen
game cassettes for an additional $10.)

Reset Button: Plugs into cartridge slot, $10.

SOFTWARE:

1)Pilot Programming Language
w/"Turtle" graphics, (Educators'
package), $10.

2)Conversational Italian (learn
Italian with your computer!) - $9.

3) Timewise (Time management), $9.

4) "Kingdom" (Instructions and
game, cassette), $3.

5) "Biorhythms", (Instructions and
game, cassette), $3.

6) "Super-Text" word processor
(disk), $4.

7) "Atariwriter" (Cartridge), 2 avail., $20. each.
Excellent word processor for Atari

8) "Atariwriter+" (Disk), includes 130XE version, $20.

9) "SynsStock" (Stock charting) $10.

10) "Sargon III" (Chess program) $10.

11) "Atari Spell Checker" for Atariwriter and Atariwriter+, $15.

12) "GO" (Ancient Japanese game, harder than Chess) $9.

13) "The Newsroom" $10.

14) "Movie Maker" (Animation Construction Set) $10.

15) "Proofreader" (Spelling Checker for Atariwriter), $15.

16) "Your Personal Net Worth", $10.

17) "Managing Your Stocks", $10.

18) "Softporn Adventure", $5.

19) "Pinball Construction Set", $10.

20) "Personal Inventory Manager", $5.

21) The following from XLEnt Software, $15 each, or all 5 for $65.:
(A full desktop publishing sytem for the 8-bit Atari)

a)Megafont II
b)The First XLEnt Word Processor
c)Rubber Stamp
d)Typesetter
e)Page Designer

22) Atari BASIC version "C" cartridge. Eliminates bugs in built-in versio

"B".

BOOKS ($3.95 each plus shipping)

Atari Programming with 35 Programs

An Atari in the Classroom

Your Atari Computer

PLEASE ADD $5. FOR SHIPPING TO ALL ORDERS UNDER $35. I WILL PAY
SHIPPING ON ALL ORDERS OVER $35.

All these prices are negotiable. I am especially receptive to package
offers that move a lot of items!

****SPECIAL BARGAIN OFFER****: The items above total more than $350.
IF YOU TAKE EVERYTHING---$200. postpaid.

Please reply by e-mail.

Sorry for using up the bandwidth, but I just transfered back to Portal vs Delphi. If by chance anyone sent be mail there, I will not be back to retrieve it. I just cancelled the card I was using for Delphi since it was an easy 800 number & got a new card. FYI this was the same thing I did when I left Portal & apparently the services do not like this at all! They tagged me with over a $100 in fees for pulling this. There goes my computer budget for the next year! Anyway, the real reason I'm posting this is it seems like none of my post are getting through ergro test.

Sox needs a patch to be able to convert from .au to .wav I think which is pretty ridiculous. I assume the market it was aimed for was the workstation market.

My advice is simple. YOu've only got 4 nybbles to worry about. Just go by trial and error to find the significant nybble.

As I read a recent post from Col. Reaser I couldn't help feeling nauseated by a certain sickly sweet, faintly familiar odor, which fortunately passed when I came to the next issue of the Digest. Just a coincidence, I'm sure.

I hold the opinion this newsgroup would be somewhat improved if topics could be limited to relevant issues instead of goodie two-shoes preaching more suited to the Primary Sunday School class. Just my opinion, of course.

As for myself, I will always speak plainly in any forum of my choosing. To assist if I can, to raise issues if necessary. I'll even take a flame or 2, but preaching in this forum is enough to sicken us all. Yes, yes, we all know we should be good little boys & girls. But this is the ATARI8 forum, not House Beautiful. I log on here because I want to see the Good, the Bad, & the Ugly when it comes to Atari 8-bits- as I've done for the past 5 years. The plain truth, warts & all. Let's leave the Ivory Snow in the kitchen where it belongs.

I don't have much experience of other newsgroups. Perhaps every newsgroup has a Pollyanna? If so, then maybe this group is just catching up with the times, & I must make allowances.

Okay. Welcome to the Digest, Colonel Pollyanna. Many happy returns.

- Ben Poehland

4695. ANTIC Pin Numbering

Newsgroup: comp.sys.atari.8bit
Date: 1994-08-14 08:14:44 UTC
From: b.poehland@genie.geis.com
Message-ID: <199408140814.AA292952047@relay2.geis.com>
Source record: 98967

ANTIC Pin Numbering

Uh, gee Michael sorry if this is a bit late, but I'd like to comment on your recent problem with chip markings in the XL/XE computers while you were trying to install a Newell XE 1-meg upgrade.

ANTIC & all the rest of the LSI chips in the XL/XE machines ALL have standard pin numberings. Guaranteed. Absolutely. You have the Alchemist's word on it.

The problem is determining pin #1. For reasons best known to Satan (who has been working at Atari for a *long* time), some LSI chips have dimples next to the notch on the WRONG side of the chip (the upper right side). These dimples mark pin #40. Relative to the notch, pin #1 is ALWAYS on the upper left of the chip. It's like that on all chips, whether they're custom Atari LSI's or just plain-vanilla TTL gates. Perversely, I've even seen a few chips with *no notch* & a dimple at pin #40: this is an outright trap set to snare the unwary weekend solder-jockey. It looks like Michael Current fell into this one, pungi stakes & all. My sympathies....

The easiest way to correctly orient the chip numbering is to always remember that Atari laid out ALL the XL & XE boards with most chips facing left (those that don't face left face the rear of the board). Pin #1 will be the first pin on the side closest to you, at the left end of the chip. (Assuming you have the board oriented with the RF, PBI & SIO ports etc. facing away from you).

This kind of situation is where the SAMS ComputerFacts or Atari field service manuals really can make all the difference between disaster & success if you have no place else to turn to. When I installed my 1-meg in my 800XL & had problems, neither Newell nor CSS was any help. People I knew who had the 1-meg were also no help, since all of them had had someone else do the installation for them (or had given up on it as being too difficult). So I had to tough it out on my own, eventually discovered I had 2 PIA connections crossed. The documentation accompanying the Newell 1-meg upgrades is absolutely horrible, guaranteed failure for the casual hardware hacker & a pain in the ass even for seasoned veterans. Best, B&C, & ATV still sell the Atari hardware manuals, but many people balk at the prices. But it only takes one Newell Experience for you to realize that whatever you paid for these manuals is nothing compared to the aggravation & mental stress they can spare you. I regard my collection of hardware docs as worth their weight in gold, the intial investment has repaid itself a thousand times (even though I too bitched at the prices I had to pay for them; I stopped bitching a few years ago).

Fortunately today things aren't so bad as they were for me. Today people can call Mike Hohman at FTE for Newell problems & at least get knowledgeable/

sympathetic/competent advice-- which is more than Wes Newell ever gave me.

Hope this helps anyone else contemplating a Newell 1-meg upgrade.

- Ben Poehland

PS- In all fairness the Newell 1-meg is a real blast once you get it working. Having a 1-meg RAMdisk is fantastic for making large file uploads or downloads or for splitting large files in memory or ARCing/UNARCing stuff. It's just that Newell's style of product presentation is about as user-unfriendly as it gets. No wonder it wasn't a runaway best-seller. Really a shame. Maybe FTE will revive the product with decent docs & an improved installation procedure. For folks who might not want all the power of the MARS8, just the memory.

4696. APOLOGY OWED TO JEFF MCWILLIAM

Newsgroup: comp.sys.atari.8bit
Date: 1994-08-14 08:16:42 UTC
From: b.poehland@genie.geis.com
Message-ID: <199408140815.AA297122159@relay2.geis.com>
Source record: 98968

In response to my criticism of Pab Sungenis for his unwarranted attack on Jeff McWilliams, I'm glad to see Pab has come to his senses & proffered the appropriate apology. Well done, Pab!

In his response Pab briefly suggested that such support of classic-8 machines as still exists is mainly here in this newsgroup (or on networks generally?). I can only shake my head at seeing this myopic/chauvinistic view expressed here for the umpteenth time. It seems to be a view held by people who inhabit networks & whose visionary horizons are thereby severely compressed. It just isn't true. I am in possession of what may be described as the largest & most comprehensive database of 8-bit users ever compiled (several thousand names), & although I haven't performed a strict statistical analysis it's a fair estimate that fewer than 25% of those people are on nets. Modems just aren't the most popular peripheral. Not just among 8-bitters, but among the computer world generally, including those of IBM persuasion. Last figure I saw on % network usage was a figure like 20% of computer users. The plain fact is, the vast majority of 8-bitters who subscribe to ANY Atari magazine ARE ONLY REACHED BY POSTAL MAIL.

Pab also invited me to admit that "AC was a mistake".
Geeze, sorry Pab, I can't do that, as your premise is dead wrong.

As Michael Current pointed out, AC isn't a "was", it's an "is". I got this little yellow postcard in the mail yesterday from the new AC in California. Seems they've registered my subscription & are sending me my first issue in the last week of August (I won't be here, but it will be high on my list of mail to retrieve!). Having been unemployed now for several months I too am in dire personal circumstances. But I can spare $34 for a sub to AC.

There are presently 100-200 people supporting the new AC. THEY obviously don't think it was a mistake.

In any event it would be entirely inappropriate for me to make a statement on whether AC is or isn't a mistake. If indeed it is, then it's a mistake on the part of the entire 8-bit community (which is mainly composed of folks who haven't yet discovered the "Information Superhighway", even though the idea itself was born right here in this newsgroup). It would be presumptuous of me to speak for those people.

Strictly speaking, Jeff McWilliams is the only person who is empowered to offer the opinion you requested, as he does represent the original 615 members of the community whose affirmative responses to the question of an all 8-bit magazine were responsible for getting the ball rolling.

Perhaps you would care to pose the question to him?

- Ben Poehland

Yes, the Intel demo (both disks) is at nova.pvv.unit.no
(/pub/Atari/8bit/demos/intel?.dcm), and has been for quite a while :)

Help !

Can anybody write me a routine in which the first line in GR.0 ist
scrolled smoothly vertically.
It's been a long a time since I've programmed this and now after I've
scrolled a line the others "jump up". I've forgotten how to solve this
problem.
SO PLEASE WRITE ME A MAIL FAAAST ! EVERY HOUR COUNTS !

CU and Thank you !

Freddy.

4700. Corvus Hard Drive for sale. Also magazine collection

Newsgroup: comp.sys.atari.8bit
Date: 1994-08-14 16:20:15 UTC
From: fseipel@magnus.acs.ohio-state.edu
Message-ID: <32lg7v$cra@charm.magnus.acs.ohio-state.edu>
Source record: 98971

I have an old Corvus hard drive set up to run on an Atari 8oo.
I have both 10 and 20mb units. These are large drives -- buyer pays
shipping. I will include the Atari 8oo (codename Candy, for you
die-hards) with modified personality board (the so-called 'Integrator',
by David & Sandy Small of Magic Sac fame, but in their 6502 heyday
[1983]).

I also have the 'Mirror' card for the drive (allows backups to a VCR
via standard RCA jack. It's the only tape backup system for the 8-bits
that I am aware of -- it would make an interesting study for a
hardware hacker trying to develop a tape backup system). The special
personality board (Integrator) replaces the standard 10K OS ROMS. With
it you can swap drives (physical drives 1 through 8 may be assigned
any number from D1: through D8: -- as can RAMdisks and Corvus volumes).
The Integrator also handles an Axlon RAMdisk at the operating system
level (you can boot from it, run unprotected full disk software from
it, etc, since the OS is patched at the level where it gets and puts
sectors. The hard drive operates the same way. The hard drive plugs
into joystick ports 3 & 4. I have two of these units. I also have
one IBM interface card. I do not have an Axlon RAMdisk. Note: Corvus
drives work only with Atari 8oo's, NOT XL/XE's, since the interface
cards plugs into ports 3 & 4 on the 8oo, and XL/XE machines have only
ports 1 & 2. Second Note: The hard drive is partitioned in either 64
volumes of 180K each, or 128 volumes of 90K each. Any DOS may be
used, since to the DOS, the drive acts like a floppy (the operating
system is patched to handle the hard drive -- there are no device
drivers or special DOS's) [previous numbers were for the 10 mb drive].
Third Note: These drives were previously used to run Atari 8-bit BBS's.
The old 'Carina 1' BBS software comes pre-installed, along with MyDos,
and about 1,000 public domain programs per drive. One was used to run
the A.C.E.C. BBS, the other the Pandora BBS.

Price: Best offer in the next two weeks, however low, gets it. BUYER
PAYS SHIPPING (it is rather heavy) REGARDLESS OF OFFER.

Second item: Huge collection of Antic and Analog (plus a few Explorers
and Current Notes), near complete sets from around 1983 / 1984 up until
they died. I will throw in A.N.A.L.O.G. Compendium (ANALOG stands for
Atari News And Lots of Games, for you afficendos), Atari Software Guidebook
1984, and anything else I can find.

Price: Best offer in the next two weeks, however low, gets it. BUYER
PAYS SHIPPING (it is REALLY heavy) REGARDLESS OF OFFER.

The 8-bit is dead.
Long live the 8-bit.

4702. Re: Atari 600XL memory upgrade info

Newsgroup: comp.sys.atari.8bit
Date: 1994-08-14 17:39:18 UTC
From: ral@iglou.com
Message-ID: <1994Aug14.173918.22541@iglou.com>
Source record: 98973

At the request of several users who have asked for info regarding the upgrading of the 600XL to 64K, the following text has been pulled from the February,1988 issue of Michigan Atari Magazine by Don Neff.

This memory upgrade requires 3 short lengths of wire and two memory chips (HM50464P or equivalent 4464) to provide a full 64K.

In addition, the diagrams have been converted to ASCII characters to give you a better idea of what you will be looking at.

Performing this (or any) modification is done at your own risk.

MAKING THE MODIFICATION:

Open the case of your 600XL and remove the circuit board. The 4416 (4 bit x16K) memory chips, U11 and U12, are located at the front right corner of the cartridge holder. Gently remove both of these chips and replace them with HM50464P (4 bit x 64K) memory chips (or 4464 equivalent).

Remove U16 (a 74LS51 chip to the left of U11) and bend pin #8 up so it sticks straight out from the chip body as shown in Figure 1. Insert U16 back into its socket. Unsolder and lift the lead of resistor R36 (as indicated at point "Y") in Figure 1. Solder a jumper wire between this resister lead and pin #8 of U16 (point "X"). Insulate the ends of the jumper so that they will not touch other parts of the circuit.
of the circuit.

Locate U5 and U6 (74LS158) which are directly in front of U11 and U12. These chips handle the row and column addressing inside the memory matrix. We have to add two lines to these chips. Gently remove U5 and bend pin #3 up so it sticks straight out from the chip body as shown in Figure 2. Insert U5 back into its socket. Now remove U6 and bend pin #10 out and replace it back in its socket. Notice that the two pins you bend are nearly touching the other chip. Cut enough off of each of the two pins to prevent any shorts.

Locate U14 which is to the left of U5 and U6. Notice the circuit traces to the left of U14. We are interested in the two traces indicated in Figure 2 as points "C" and "J". Connect the jumper from the pad at point "C" to point "D" (pin #3 of U5). This jumper sends address bit A15 to U5. Connect jumper from the pad at point "J" to point "K" (pin #10 of U6).

Make sure all your IC ships are inserted properly with their #1 pins in the lower left corner. Check your jumper wiring agains Figures 1 and 2.

You should have a jumper from point "X" to point "Y". You should have a second jumper from point "C" to point "D", and a third jumper between points "J" and "K". Make sure the jumper ends are insulated to prevent shorts with nearby objects. Reassemble your computer case and run the memory self test as a final check.

If all has gone well, you should now have the same memory capacity as a stock 800XL.

4703. 600XL RAM Upgrade

Newsgroup: comp.sys.atari.8bit
Date: 1994-08-14 19:38:31 UTC
From: b.poehland@genie.geis.com
Message-ID: <199408141938.AA282533079@relay2.geis.com>
Source record: 98974

600XL Plug-In RAM Modules for Sale

I have two 64K RAM upgrade modules for the 600XL to sell.
Price: $20 each or $35/both, postpaid in the USA only.

These modules contain 32K RAM that plugs into the PBI of the 600XL. That RAM adds on to the 16K RAM the 600XL already has, giving the 600XL a full 48K RAM which makes it equivalent to the free RAM in a stock 800XL. You just plug it in-- no muss, no fuss, no tools.

The modules are nicely made, the outside case has color & texture that matches the XL case perfectly. No docs, sorry. The modules are made by "RC Systems", a company I've never heard of & probably faded into history a long time ago.

In concert with a Super Video upgrade, this module would make any 600XL fully equivalent to a stock 800XL, only in a smaller package. Pretty cool. These are a very rare beastie.

Contact: Ben Poehland [b.poehland@genie.geis.com]
USA buyers ONLY.
Enquiries after 8/16/94 will be ignored.

Thanks, Everyone!

I'd like to express my thanks to the many people who sent me messages expressing their support & concern in the wake my recent official departure from AC. I can't respond to you individually but was deeply moved by the sheer volume of well-wishers.

As to AC, I'm confident that the vision of those involved in the grass-roots movement that began almost three years ago has been entrusted to good hands. The torch has been passed, even if the flame is bit dimmer now than it was when the idea for AC was first hatched in this newsgroup. It's a great comfort to me to know that the final chapter of the AC Experiment has yet to be written, & I look forward to seeing what the revived publication will achieve.

As regards my personal circumstances & the possibility I might make some direct contributions to AC again in the future, I can only say that's an open question. I'm pretty much recovered from the shock of events but can only be philosophical about it. There are just certain things in this world that really are in the hands of a Higher Power, modern science & the global economy notwithstanding.

If an opportunity arises for me to contribute to AC, I shall certainly do so. I have at least 6 tutorial or hardware projects frozen in various states of completion. Those of you who know me understand that my style is not to make a promise unless I'm pretty sure I can deliver. Right now I'm not sure about anything in my future, so I must refrain from making commitments. If The Alchemist should ever make another appearance in AC, it'll just have to be a pleasant surprise.

Again my thanks to everyone.....

Do you have a one-chip or two-chip SIO2PC? The "i" versions default to the one chip style of operations. AT<CR> will switch between the two modes.

I have 3.18i, but I'm using 3.07 most of the time. You can put the 'AT<R>' command on the tail, but the screen jump was annoying to me...

I assume that's your trouble, but I've been wrong.

Autoexec.bat is probably the most impressive demo I've ever seen for the Atari 8-bit. Well, I'm sure other stuff is cool like showing impossible numbers of PMGs horizontally and all that, but this one is much more "practical". It's not just eye-candy. It's actually a viable multicolored polygon engine. It looks like something Lucasfilm would have come up with. It does "glitch" a little which may be the way it's drawing to the screen but it's still awesome.

I mean, there were lame ANTIC programs for doing line-based polygons in graphics 8 that would take a year to calculate and plot. This one does solid multicolor polygons in real-time with sound so there is SOME CPU availability leftover!

If you don't want to be spoiled, don't read below:
^L

^L

You will think you are watching STARFOX on a SNES in parts of this demo. It starts rendering increasingly complex polygons. Eventually it creates a bird-plane that flaps its wings, and even a HELICOPTER flying around. Not only that, it does some kind of "see through" 2-D thing where one of the sides is an underlying bitmap picture (bugs bunny) which is very cool.

An engine like this could very will be applied to a videogame if there is enough CPU availability leftover. That is, if it is indeed a true engine (which it seems to be) rather than some kind of prerendered hack.

4715. Help! Hooking 2 1050s

Newsgroup: comp.sys.atari.8bit
Date: 1994-08-15 05:53:47 UTC
From: b.poehland@genie.geis.com
Message-ID: <199408150553.AA176659990@relay2.geis.com>
Source record: 98986

Hello Scott,

RE: your problem hooking up the 2nd 1050 drive-- ERROR 138 is the dreaded "Device Timeout", which means that the computer is looking for the drive on the SIO but for some reason can't find it & gave up upon failing to receive an ack after a period of time.

There are several causes for this, ranging from simple to ...messy.

SIMPLE:
You set the switches wrong. Sounds like you've already covered that ground pretty well. Just in case, for D2: the black switch is over to the right & the white one is on the left as you look thru the hole in the back.

MESSY (in order from least messy to most messy):
1.) The drive select switch is bad. It happened to me once. I replaced the switch with one taken from a junker 1050. The drive worked only in the D1: position & no other positions would work. Weird.
2.) Your SIO cable is bad. Try a different one.
3.) The SIO socket(s) in the drive are bad. Not very likely, 1050 sockets were fastened down pretty well, & tho one may get worked loose it's rare for both to fail. I never saw a bad SIO socket in a 1050.
4.) The 3086 chip (U1) is blown. Now it gets hairy. Replacing that chip is a pain in the neck. It's very hard to reach, & 90% of them are soldered. Blowing this chip is usually accomplished by the user making SIO connections with power applied, I consider it a form of user neglect.
5.) The 6532 RIOT chip (U7) is blown. Lotsa fun, now yah gotta pry off the RF shield & go rooting under there. A 1050 with a bad RIOT will act dead. Uh... you *do* have a drawerfull of spare 1050 replacement chips, right? (Once you get into chip-swapping you're in pretty deep!). RIOT failures are disgustingly common, I don't know why.
6.) The 2793 FDC chip (U13) is blown. Rare, but it happens. Expensive little booger, too. Fortunately it's easy to tell if you got a defective FDC, as the drive usually won't initialize properly when you boot it up (with or without the SIO cable connected).

Somewhere in the above will be found the solution to your frustrations, I'm sure. I only have ten 1050's around at the moment, but over the years at least 50 have passed thru my hands (most of which I repaired & sold). The above checklist never failed to reveal the problems in a 1050 that was playing possum.

Hope this helps..... - Ben Poehland

4716. 810 Alignment Software

Newsgroup: comp.sys.atari.8bit
Date: 1994-08-15 05:54:08 UTC
From: b.poehland@genie.geis.com
Message-ID: <199408150553.AA176930007@relay2.geis.com>
Source record: 98987

Ben Smith asked for info on 810 alignment software...

I've never been a fan of the 810 but such software is readily available from both Best & B&C for the 1050. Pretty good bet you could get the 810 alignment software from those sources if it's available at all. You might even be able to use the 1050 software since they're both single-sided drives.

However, the alignment software by itself is worthless. You'll need the Dymek Alignment Disk as well. Best sells those also, tho their price is a bit steep. The Dymek disk is a master precision preformatted disk with a certain pattern on it (E-5 pattern, I think) to which all floppy drives of a given capacity are standardized regardless of their system OEM. You can also get the Dymek disk from Jensen Tools in Tempe, Arizona a little cheaper than the Best price.

I hope your tech skills are up to snuff. To do the alignment you'll need a dual-trace oscilloscope with a calibrated timebase, & preferably with a bandwidth of 5MHz or better on the vertical inputs.

You'll also need the alignment procedure, from the Atari Field Service manual (SAMS manuals are worthless for this, they don't give alignment procedures). Again this manual should be available from Best.

You do the alignment using the classic "cat's eye" on the scope display. I've done a few of them on 1050's & hate it. It requires extraordinary skill. Just getting the drive held in the proper position while you diddle the screws & watch the display is a juggling act: you need six arms & eyes in the back of your head. Very much like setting the timing on an old Chrysler 318 V-8 with the distributor back near the firewall & the timing light at the front of the engine. Great fun for masochists.

Hope this helps..... - Ben Poehland

4717. STR() function in C

Newsgroup: comp.sys.atari.8bit
Date: 1994-08-15 05:54:33 UTC
From: ericl@bert.cs.byu.edu
Message-ID: <ericl.776930073@bert.cs.byu.edu>
Source record: 98988

I am looking for the C (either Ace C or CC8) equivalent of the BASIC STR() function. That is, a function that will convert an integer to a string somewhat quickly. I have been trying to modify the ML code for the Action! StrC() routine with little success.

Also, while I'm at it, I also need the C equivalent of the Turbo-BASIC XL TEXT function that will print (bit-map) letters to a graphics screen. I wrote one myself but it's rather slow.

Any assistance on either of these two topics would be appreciated.

-- Eric

4718. Page6: What's Happening?

Source record: 98989

Mike asked about Page6 in England...

I don't have details but am aware NAU readers are getting a case of the heebie-jeebies. I received a letter from an AC subscriber last week expressing concern over Page6. First they announced their June issue would be a month late & not appear till July.

But it didn't appear in July either. Now it's well into August & people are still waiting.

I don't know if I'd panic just yet. NAU has been late before, Les Ellingham is always writing editorials apologizing for being late. I'd wait till September before freaking out.

Still, it doesn't sound good. NAU has had a rough year, the tone of Les's editorials has acquired a distinctly more strident timbre lately. They are facing the same problem that almost killed AC: failing support.

I don't think *any* Atari magazine can claim to be in good health these days. If you find one whose reader base is merely static, it's doing well! None I think are actually growing. The healthy magazines are merely losing readers more slowly than the rest.

From: kendrick@zippy.sonoma.edu
Message-ID: <32n1h0$4l2@nic-nac.CSU.net>
Source record: 98990

Ok, you want a STR$() type function in C, huh? Hmm.. it's been a few months since I've touched C (and I've never used it on the Atari) so don't trust this thing to work right off the bat! :)

Here's what you want to do.. oh wait, are you using floating numbers or integer numbers? I'll assume you're doing integers because, well, that makes it easier on me :)

Determine the sign of the number.. positive or negative..

if (number<0) should do for that test.. if this is true, then start the string with a "-" character

Now, I'm gonna cheat because I know 2-byte long integers never go above 5 decimal places (-32768 to 32767)

We can do this: go from 10000 down to 1.. take the DIV (/) of the number by these guys and if the result is not 0 (or we're dividing by 1), then add this to the string.. so "1234" would return 0, 1, 2, 3, and 4... 10000 would return oops :) there, I made a boo-boo.. hehe, this would say "10".. (the "1" would be added, and the last "0" would be added)

Time to change my rules. Make

(ugh..stupid modems)

Ok.. Make a flag which keeps us from ending up with strings whcih are padded with "0"s.. (like I was trying to do, but unsuccessfully)

Lemme see how the code would look:

```
void str(char *dest, int source)
{
int flag,count,divisor;

int length; /* I'm used to Action! and BASIC :) .. C strings suck! */

length=0;

if (source<1)
{
dest[0]='-';
length=1;
}

for (count=1;count<=5;count++)
{
divisor=10^(count-1); /* can this be done in C ?? what's the func? */
if (source/divisor<>0 || count==5 || flag==1)
```

```
{
dest[length]=(source/divisor)+'0';
length++;
flag=1;
}
}
}
```

As you can see, I forgot to put a "flag=0" up there with "length=0"..
And I don't remember if an expression like "3^2" returns 9 in C.. or if
you have to use some exponent command.. if anything, just do a "case"
or "if/elseif/elseif/etc" and when "count=1" make it return "10000"

OOH damn! :) That expression is wrong anyways.. 10^(count-1) returns
1, 10, 100, 1000, 10000 ... that's the wrong order.. AND I forgot to
subtract from the source <sigh> :)

As you can see, I'm no good at writing sourcecode online (in an editor I
barely know how to use! :))

You should of course do a: "source=source-(source/divisor)*divisor"..
note: this doesn't work with Floating numbers (like in BASIC).. there you'd
need an equivalent to BASIC's "INT" function.. but seeing as I'm dealing
with INTs anyways in my C code (crap :)) up there, it'd be redundant
redundant :)

have fun!

I hope it's not TOO slow for ya! :)

From: curtis@darkwing.East.Sun.COM
Message-ID: <32ntg4$3sb@walters.East.Sun.COM>
Source record: 98999

Regarding Ben's followup on the pin numbering....

I haven't been inside an Atari lately, so I can not confirm if Atari did this or not, but many manufactuers make the solder pad on the underside of the board square for pin #1. This has helped me many times with hard disks and controller cards in PCs when they were not silk screened to indicate pin #1. Hopefully Atari followed this too, and then you can always discover pin #1 by the square solder pad on the "back" of the board.

Hope this helps someone,

-- Curt

curtis.wilbar@east.sun.com

p.s. I'm still begging for information on ATR8000, and Z-tec 1000 hard disk adapter board..... maybe I should post to comp.sys.cpm (if there is one :-O)

Say Ben,

seeing as you've worked on so many 1050s.... what chip is bad if the
drive does the following:

Drive looks fine, put disk in, no problem, go to boot computer,
doesn't see the drive, and the drive busy light starts flashing
on and off and doesn't stop flashing until the power is cycled
(the drive by the way, doesn't even try to access the disk when
the computer is turned on).

Read on for the answer:

It's the CPU on the drive (6507 if mem serves me correctly).
Ever see that one.... an hour of swapping around led me to
find that one....

>much the same way OASIS JUNIOR III does. I don't know what became of OASIS
>IV as all work seemed to be halted on it once myself and other callers to
>OASIS BBSes made disparaging comments about how difficult the OASIS file
>libraries were to use. We were called ungrateful Atarians (which we were).
>Work in the USA was halted and the program was sold to someone overseas.

Actually, development was shifted to Canada. I don't think that 5.0 was ever released although one of the assistants to the developer was running a 4.7/5.0 beta thing <g>. I was supposed to get a beta of 5.0 to start working on a networking system, but I never did. The guy who was running the crossbreed thing moved from Canada to Georgia. I don't know what ever happened to the developer.

Most of the Oasis BBS's that *I* knew of are down. If anyone wants to run Oasis 4.7, I wrote some code that improves slightly on the built-in networking code. I wish I had time and money to set my Oasis 4.7 BBS up again. :(

>over the years. I wouldn't know where you could obtain the last
>incarnation of it, or if you would even want the program if you could
>find it....

Correct. MACE put out AMIS. The reason for the ring detector actually was due to the fact that the 1030 modem did not have an auto-answer mechanism. Later version of 1030-AMIS had a line to uncomment if you were using an XM301 (which DID have auto-answer).

Yeah, my memory is failing me on whether AMIS is the oldest program or not. I want to say that it is, but I also seem to remember something about an earlier program on which AMIS was based.

There are numerous incarnations of AMIS since it is written in BASIC. The last BBS I know of to use it was Molin's Den which was running a version which was heavily modified and had greatly improved file-tranfers. I'm not sure if this molin is the same one that hangs around here and has a role in the umich archive, but Molin's Den WAS in Michigan.

Source record: 98998

If anyone cares.....

I just figured out how to modify the colors in Kermit's 80-col screen
to make it a bit more readable.

This was done with v3.7. I don't know if it will work with other versions
or not.

search: Replace with:
AD 35 8E 8D C6 02 A9 xx EA 8D C6 02 (xx = Background Color)
AD 36 8E 8D C5 02 A9 XX EA 8D C5 02 (XX = Text Color)

xx=00 and XX=0C work good for me.

to change the boarder Replace with:
search (FIRST occurence):
AD 37 8E 8D C8 02 A9 xx EA 8D C8 02

These patches replace an Absolute Mode LDA with an Imediate mode one and
place a NOP in to fill the empty byte.

Source record: 99003

Thanks to those who replied, but I managed to mold the Action! StrC()
routine to suit my needs.

What I really need now is the TEXT function in C, ie. to print a
bit-mapped string to a graphics screen. Like I said, I wrote one myself
but it takes a couple seconds to print a line of text (not too terribly
slow, but still annoying). I would love to know of an ML routine that
accomplishes this, or know where the TEXT routine is located in
Turbo-BASIC XL. Again, any help will be appreciated.

First off, does anyone know where I can get the hacked disk version of Action? Yeah I know its pirating and all but I have the cartridge of Action! and since I have a 130XE, it messes up if I even slightly move the computer! ARGH! You know how many programs I've lost?? I should save more often but I just forget to. Anyway, why isn't there some kind of an interface that connects thr Atari to the PC's hard drive via a printer port (on both sides)? On the C64, there is 64net which allows you to actually use the PC's hard drive with a cable from the PC's parallel port to the user port. Seeing as how the directories and filenames in DOS and Atari are pretty similar, it shouldn't be very hard to do. Then again, if it WASN'T hard, why would there be a an SIO2PC? I don't like the idea of disk images. I'd rather just use MyUTIL and download everything to my PC. Another thing: Does anyone know if SIO2MIDI works well at all? Sounds kinda flakey (kinda like the ASP Sampler which sucked). Lastly: Can someone mail me the Stereo upgrade plans? I can't find them anywhere! Oh wait, one more thing: I WANT HALLE PROJECT 94! Anyone seen it? Cmon, you German guys have to have seen it! YOU! The guy that was posting of the ABBUC BBS: You MUST have it!

```

>back to single to read single or enhanced density disks or can it be
>left on double all the time and it'll read in whatever density the
>disk happens to be formatted in? Oh yes, what's the fourth switch
>for? I can't recall what it's called.

The 4th switch is called AUX.

The indus is density smart, ie it will set it self to the density of the disk that is in the drive. what the density switch is for. When the drive is powered up, the drive sets it self up to the density set by the switch. Any disks that are inserted, the drive changes density to suit. I cannot see a real need for this switch with the density smart dosses. I guess it was there for dos xl, because dos xl can only work as single or double, not both at the same time (at least not very easily). You use the indus the same as any other drive, Set density first in dos then format your disk.

Some little known facts.

Hold down drive type button and press track button. This cycles between densitys. A=single B=double C=enhanced. First number is the drive number the drive is set to.

Hold down drive type button and press error button. Drive will set it self up to the density of the disk that is in drive.

The AUX switch has NO function. It is NOT connected to any thing. The only thing i can think of why it is there is because it is a bit hard to get a 3 switch dip.

Please post this to all. My postes to the group do not seem to be getting through.

Help !

Can anybody write me a routine in which the first line in GR.0 ist
scrolled smoothly vertically.
It's been a long a time since I've programmed this and now after I've
scrolled a line the others "jump up". I've forgotten how to solve this
problem.
SO PLEASE WRITE ME A MAIL FAAAST ! EVERY HOUR COUNTS !

CU and Thank you !

Freddy.

Hello Folks !

Is here anyone wanting to tell me why Spartados X is MS-Dos-command
compatible and Spartados 3.2F has its own commands ?

Does there exist any programm to translate files from Spartados-disk-format
to Dos 2.5 or Dos 3.0 format ?

Where can I get it ?

Thank you
Matt

4738. R:P: Availability

Newsgroup: comp.sys.atari.8bit

Hello 8-bitters!
Spoke with Bob Puff today regarding R:P:conn and blackbox,
he said that R:P is put on hold, due to lacking interest, and difficulties
in obtaining certain hardware..
He hoped that RP: would be available this year alteast..
It was not discontinued.
Another factor was that he was too heavy involved in another projects
right now, what that might be..:-0 ??
Hmm.
I feel that R:P: would fit in nicely for the growing number of SIO2PC
demanding high-speed transfer at reasonable cost..
Well atleast they can use the CP for modeming...

Lack of interest? That's a crock. Puff must be totally out of touch.
I've been fanning the hype on the R:P: for a good 6 months and I know
several people are looking forward to it.

Well, if the R:P: doesn't get made I won't put my BBS back up. I'll sell
my MUX and quit being a sysop.

No interest, yeah, right.

Yup, they're ignoring it. I doubt anyone is hurt by spreading
old software. It's very hard to find a place where you can
still get it legally, and these old games are no serious
competition to sales of native modern software.
I've never been much of a C64 fan but that machine shares many
of the same classics with the Atari 8-bit. Emulators like
C64s and C64neu allow me to replay a lot of those games
without having to deal with decomposing floppy disks. But
because the graphics and sound on the Atari versions is often
superior (and sometimes worse, I have to admit it) and just
for nostalgia's sake I'd like to able to do the same with
Atari software.
I hope someone will provide an archive site for commercial
8-bit stuff as well. If I'd get a SIO2PC cable I'd have plenty
to contribute.

Gegroet, Michiel

The "lack of interest" thing is an alibi from Puff I think. The only thing I know of that Puff kinda promised but never delivered on was the VCR backup and he had technical reasons for not releasing that. Puff's so deep into the R:P: thing that it would be a huge embarrassment to him and his company to not finish it. He did that very overt mass mailing talking about the R:P: complete with release date estimates. If he was unsure about whether he WANTED to release it or whether he COULD he never would have gone that far.

Months ago when I talked to him, he said that no matter WHAT happens, that he is dedicated to at least produce an initial batch.

My advice is to keep tabs on it, and when it is released, get one even if you don't have enough money for a HS modem because you won't know how many runs he'll make.

I plan on getting two.

The price is supposed to be no more than $60. He may intellectualize (this is just a guess) a $75 price tag if he throws in a handler disk and manual and built in Term on ROM or something. You know how it is.

It's definitely not meant to be a budget-buster like the BB/FB.

But although I was expecting it to be out any day now, I've given up that mindset and I won't even think about being a sysop anymore until it arrives.

4750. WANTED: SAMS Photo Facts for the Atari!

(Private mail to Matthias failed, so I'm posting response here.)
Matthias, I think maybe you are new to SpartaDOS. The only thing you
need to do to copy files from a SpartaDOS disk to a DOS 2.5 disk is
type 'copy dn:file.ext dx:' where n and x are the appropriate drive
numbers. Either that, or I don't understand your question. SpartaDOS
is DOS smart, it will copy files to from SpartaDOS, DOS 2(.5) and MyDOS
without any special effort.
--
(Also, DOS 3 is incompatible with everything, not even SpartaDOS will
read/write DOS 3 files.)

From: jperez@uhunix.uhcc.Hawaii.Edu
Message-ID: <Cuov5v.Gu1@news.Hawaii.Edu>
Source record: 98929

I just picked up a 130XE and XF551 without any documentation. I also got the DOS XE disk. Is there anyone that can give me some help with the features that are unique to the 130XE and XF551? From what I can tell, the double sided, double density format from DOS XE is not compatible with anything else (not even the programs that I have tried to run under it). HELP! Seems kind of silly to have a double sided drive if I'm only using one side.

: Thanks!

Yes, this was released on the atari 8-bits in the form of a public domain program that runs on Turbo Basic(also public domain). I think my source for this program was the Atari Base(the atari-sponsored BBS). Although the program is written in BASIC, it runs surprisingly fast under Turbo Basic. If you are having trouble finding this, you can e-mail me to see about getting it. The last time I called Atari Base with my computer, only a few 8-bit files remained.

If the copy of INTELB.DCM you have is less than 4k, then yes, it's BAD! :)
It seems to have been truncated. What's sad is it's also a DD disk image.
MOST Atari users on the net have at LEAST a 1050 (which is what MOST of the
european disk images seem to be.. :) In europe it's usually 1050+800xl :))
but folks like me have to deal with getting SIO2PC to work in DD (I'm not
used to that :)) and stuff, so what I'm going to do soon is release the
side B disk as two SD images.. NOT bootable.. NO player on it. The player
is "FORMAT.EXE" on side "A" of the Intel Outside demo. What REALLY sucks is
the SoundTracker player ("FORMAT.EXE" and the boot file on side B) does NOT
like most strange disk formats. I couldn't get it to work under large disk
image files with SIO2PC, nor could I get it to even recognize a disk 'image'
which was created by an installed file! :(So I had to settle with copying
all of the MD8's I had onto my RAMdisk and then make a pair of fresh SD 88k
images in SIO2PC and copy everything to them. That worked, so I'll leave 'e,
('em) like that :)

Did you watch the whole thing with the helicopter? Let's see you do it
:) John Harris said he too thinks the flicker is a PAL thing. Maybe
he'll manage to disassemble it and patch it for NTSC and if that's what
you didn't like, it will run smoother.

The mod-player writer seems to know all about Pokey, but he has no idea how to implement generic I/O to allow any MODERN media.

It's pretty screwed.

Well thats not what I didn't like about it. I've seen thousands of demos with vectors and those ideas are kinda old. The only idea that was really cool was the fuji logo..But other than that, I have seen it all before and much better done. They could have made the helicopter shape a little better. But anyway, one thing that REALLY surprised me in one demo was an entire house out of solid vector being rotated..This wasn't on the atari tho. Best thing about the intel outside demo was the the scrollers and maybe the fractals (those were surprising!). I had just been watching a fractal demo not five minutes before I saw that. I liked it. But to this day, the Cool Emotion demo by the Hard Soft gods is the best...

BTW: I uploaded intelb.dcm to nova...hopefully, it will up soon. I stuck it in the incoming directory...along with an intel.readme that corrected what the other one said. The other one said it was a MOD player, but it isn't. I corrected it to say MD8 and also added a line saying "This copy of intelb.dcm works" and so on.. I was going to post it uuencoded here, but I decided against it (while I was actually doing it! It kinda screwed out connection to the newsreader for a while)... How come nobody replied to my post about whats on my mind? Geez. People don't reply on here unless they are big experts on something or they have something to gain from it. Maybe its just me but it seems Bill and I are the most active ones! :)

Your attitude really BUGS me. I don't know about anyone else, though. I mean, by your text it seems like you are sitting by watching the demo with a smirk on your face saying "ho hum, nothing special". Yet you failed to mention a single example of anything we can compare it to which you claim is better. Also, I have never seen a game use true solid polygons before. Lest you forget, in the late '70s, line polygons were considered the best a slow 6502 could do, hence Elite for the Apple II and such. The best 3-D I've ever seen on the 8-bit for a game was the Lucasfilm 3-d landscape engine, but they did not have a polygon engine.

Bill Kendrick not so long ago asked for some help writing a game in which the presence of at least one large polygon object would be necessary. This engine may fit the bill rather nicely. Overall this demo proved to me what the Atari can do which has NOT been seen before. Unless you can back up your haughtiness with some examples, I won't believe you. If you are comparing the demo cross-platform then you and everyone else knows that isn't fair. I was impressed with the demo for its own sake in the 8-bit domain.

4767. Port B (of the PIA) in 800XL

Newsgroup: comp.sys.atari.8bit
Date: 1994-08-18 03:38:06 UTC
From: napoli@bliss.uucp
Message-ID: <CuporI.6HH@bliss.uucp>
Source record: 98900

Can any of Port B of the PIA (sticks 3 and 4) be used in an 800XL? I
was interested in using the joystick ports to control external devices, but
was cramped with only two ports.
I took apart one of my 800XL's and found a 6520 (or CO14793?), which
are the same numbers as the schematics for the Atari 800 that I have
(unfortiantly I don't have schematics for the 800XL). There appear to be two
traces going to two of the pins which correspond to Port B (it looks like they
might go to pins 11 and 14), but I can't trace their origin. The rest of pins
10-17 appear to be unconnected.
When I read from address $D301 (PORTB) I find that bit 1 is 0, which
would corrispond to pin 11 on the PIA chip (the rest of the bits are 1).
Can I use the remaining pins for input and output safely? Also, what
is pin 11/bit 1 (and pin 14?) used for, and why were these two joystick ports
removed from the 800XL (and following models?)? Also, on my Atari 800
schematics, why do the lines from port B have a 4.7K resistor to +5V while
the Port A lines don't?

Also, where can I get this kind of hardware information for the 800XL?

Thanks,
Joshua Napoli

Heheh.. I bet the same was said for the first sinus-wave scroller :)

Sure, they look pretty crappy and simple, but you've GOT to ALWAYS remember
the fact that they're running at 1.79mhz on an Atari 8bit with a 6502!!!
The BEST part of the whole thing is...

THAT IT EVEN EXISTS!!

I mean, it's hope for anyone who'd like to try it and perhaps one day do
something either more useful or more impressive (or hopefully BOTH!) with this
type of stuff!

Can we say Spectre-XL?

Or a simple version of the DOOM/Wolfenidiot games?! :)

DUDE! I've seen better 3D crap than lame solid 3d houses (I have (had?) a copy of a few VR houses.. one of 'em was Elvis's hehe.. for the >>PC<<... no biggy.. I wasn't impressed. In fact, it was boring, slow, and not as good as it could be. Now, if I saw that on the ATARI, I'd be VERY impressed!!!!!!!!! Sure, it's slow, boring, and not as good as it could be .. on the IBM! I mean, IBM's are supposedly the "best" computer (just ask anyone who either hates Macs or are IBM dealers :)). THey have all the fancy VGA graphics and fast CPUs and huge amounts of RAM and almost all of them have at least a 10mb hard-drive, and math co-processors, so you'd EXPECT a 3d house on one of 'em! But for 3d poly graphics to be rendered realtime on a 6502 is quite amazing! (Perhaps it's show-off time to the C=64 newsgroup? Heheh.. KIDDING! KIDDING!)

Anyways, have you ever seen DOOM or Castle Wolfenstein 3D?? Those are NICE. That type of graphics is what WE need. And I'm FULLY against doing it in ColorView mode even though everyone is so pro-ColorView and pro-4096 colors and all that. Sure, ColorView is great. It's awesome, in fact, BUT, it takes TOO much CPU time and TOOOO much RAM for purposes such as games. For games, stick to OS modes, or (and I'd prefer this) APAC or Pryzm modes. For example, if I were to make a game with digitized graphics and I wanted it to be in color, I'd NOT try to bother getting RGB filters (I mean, animation is a bit hard to do in RGB!... without some expensive video->R/G/B->vide/video/video conversion box or something!) I'd rather spend some time colorizing the Graphics 9 captures (I made a nifty util for that if you're wondering.. it's at the UMich archives: COLORIZ1.ARC I think, in either Graphics, Utilities, or Applications) and saving space, time, and CPU speed when the program is running! :)

But now I'm totally rambling so nevermind...

But still, sure, things like the 3D Poly demo could be better, but did you complain to Alphasystems back in the 80's that Parrot or ComputerEyes could be better?

When I'd look at (relatively) old magazines (compute!, family computing) a few years ago, those looked like the COOLEST things EVER made for the Atari!

Now I think they suck. I'd rather use a PC or something to do the video capture and then convert to GIF and then to APAC, Pryzm, or ColorView.. *brrt* Too bad I can't! :) So I spend HOURS creating stupid little simple demos like DAN9A.ARC and DAN15.ARC (and I might actually make DAN9B.ARC like I planned, but not right now I'm BUSY! :) (hanging around the net like the net-troll that I am! :)))

But still, I mean, like Glenn (?) said, >>YOU TRY TO MAKE IT!<<

Can YOU handle 3d objects with SOLID POLYGON SIDES rendered REALTIME on your Atari XL!? :)

If I had the algorhythms, >I< might be able to!

on a Power-PC! :)

-bill
kendrick@vax.sonoma.edu ||| kendrick@zippy.sonoma.edu

4771. IRC anyone?

Newsgroup: comp.sys.atari.8bit
Date: 1994-08-18 07:29:46 UTC
From: kendrick@zippy.sonoma.edu
Message-ID: <32v2la$kt@nic-nac.CSU.net>
Source record: 98949

Hey.. Is anyone out there interested in doing a big Atari 8bit IRC chat sometime soon? When Glenn first got a hold of the Intel Outside demo he said something like "e-mail can't show my true emotions about this" and wanted to chat in IRC. Then, since John Harris seemed to be online busy replying to some of my e-mail I wanted to invite him in, but then I had to go eat dinner or something so I ended up vamoosing.

ANYWAYS, I had this sorta feeling that a bright little realtime chat might do us all good!

Soo.. what say you? I shall not propose a time since >I'm< probably the FREE-EST soul out here (read: I have no life.. although I did show off Cooltris and Sludge to a friend today, and then we actually went somewhere together.. and we WALKED! My GOD, I got EXERCISE!!!!)

ANYWAYS,

who'd like to do it? Shall we set just a day/night and then people can pop in and see what's up? I'm NOT volunteering myself as the "official coord-inator" because my phone tends to boot me off a lot and I get into conver-sations with friends or have to do stuff around the house. <end disclaiming excuse :) >

And here are a few people I'd REALLY like to see show up :)

Mike from FTE
Ben Poehland
John Harris
Jeff Potter
I'd say Bob Puff but I know he's not on the net (SOMEONE DONATE AN ACCOUNT TO HIM! :))
Hard Soft
Any of the other infamous Euro-groups/clubs (ABBUC, Our5oft (yeah, right :)), anyone remaining from HTT :), etc. etc. etc.)

Sorry to all those worthy but forgotten :)

BUT, just because you're not in that list of "WE NEED YOU, NOW" folks, doesn't mean you can't join.. I mean, look.. I'm gonna be there (I hope :))

>>> AND <<< (big important final note and plot twist to follow.....)

PERHAPS WE CAN FIND OURSELVES SOMETHING TO DO!! LIKE, A >GROUP PROJECT<!

And maybe it can even become a HABIT!? :)

Well? Am I just being a blithering idiot?

-bill
kendrick@vax.sonoma.edu ||| kendrick@zippy.sonoma.edu
William (Bill) Kendrick / | \ ** New Breed Software **
Well, ok, so I AM being a blithering idiot, forget that question..
Do you folks want to have an IRC "date"?

Hey, I didn't say I didn't like it. I didn't say "ho hum nothing special".
I said that I have seen many others demos with solid vectors. You
misunderstand me. NOT on the 8bit, on every other machine. All new demos
have a bunch of solid vectors. SURE the demo was nice. SURE it was great
for the 8bit. I am saying that some of the shapes could have been less
blocky. But if I bug you, please ignore my posts.

Actually, I've never seen any GOOD solid vector demos on the PC (wait, actually, I saw one where they had raster bars through the vector). Most PC demos are nothing to look at. I have a stack of Atari demo disks that will barely fit in two disk boxes that allow 10 disks per box (I smash em in there). I only watch demos on the atari. And also, I have a few demos in APAC mode..they're quit nice (even though they flicker n' stuff). OK! Enuff..I'm dropping it.

```

4777. FOR SALE: Atari 8-bit System (COMPLETE)

Newsgroup: comp.sys.atari.8bit
Date: 1994-08-18 14:30:48 UTC
From: jis@panix.com
Message-ID: <32vrao$s0e@panix.com>
Source record: 98855
Cross-posted to: comp.sys.atari.8bit,ny.forsale

My Atari days are over,

After holding onto, and keeping this thing for who knows how long,
I'm finally getting rid of my old Atari 8-bit system. It's just
sitting around in my place not being used, so I figure, why not
sell it to someone who can actually use it.
I've taken very good care of this system, and for the most
part, it's a mint condition setup. The only thing that makes it
less than "mint" is the fact that I can't guarantee that all of the
software that it comes with works. Some of these disks are over 10
years old you know. But the last time I used it, everything worked
fine.

BEST OFFER FOR _EVERYTHING_ LISTED BELOW (I AM _NOT_ SPLITTING THE
SYSTEM) GETS IT. CASH AND CARRY IN BROOKLYN, NEW YORK ONLY.

E-MAIL ALL OFFERS, COMMENTS AND QUESTIONS TO (JIS@PANIX.COM).

ATARI 800XL: Unmodified. New keyboard put in about a year ago.
Includes power supply, video cable, game/TV switch
and owners guide.

ATARI 1050
DISK DRIVE: U.S. Doubler installed. New drive mechanism
installed about a year ago. Includes power supply,
serial cable, owner's guide, DOS 3.0/2.5 manuals.

ATARI 410
CASSETTE
DRIVE: The original tape drive that came out when the 800
and 400 were first released. I had to re-solder a
few wires, but it still works and actually comes in
it's original packaging

ATARILAB: Starter set and light module. Complete and never
used in original box with cartridges, manuals and
everything.

GAME CONT-
ROLLERS: Atari Trac-Ball, Tac-2 Joystick and Quick-Shot
Joystick.

CARTRIDGES: Atlantis, Star Wars: The Arcade Game, Missile
Command, Asteroids, Pac Man, Centipede, E.T. Phone
Home, K-Razy Antiks and K-Razy Kritters. No

documentation on any of these.

CASSETTES: Space Invaders, Moonbase IO, Hazard Run, Jaw
Breaker, Blue Max, Shamus, Shamus II, Fort
Apocalypse, Protector, Megalegs, Pirate Adventure,
Angle Worms, Action Quest, Canyon Climber, Pacific
Coast Highway, Astro Chase, Preppie and Preppie II.
No documentation on any of the above cassettes,
except for Preppie II.

DISKS: Seven Cities of Gold, Movie Maker, Mail Order
Monsters, 221B Baker Street, The Pawn, Gauntlet,
Ace of Aces and Computer Ambush. All of these
disks come in their original packaging with
documentation.

MORE DISKS: I also have over ten boxes of disks (about 15 disks
per box) filled with software, games and utilities.
All undocumented.

BEST OFFER FOR _EVERYTHING_ LISTED ABOVE (I AM _NOT_ SPLITTING THE
SYSTEM) GETS IT. CASH AND CARRY IN BROOKLYN, NEW YORK ONLY.

E-MAIL ALL OFFERS, COMMENTS AND QUESTIONS TO (JIS@PANIX.COM).

Okay, so which of those symptoms would apply to the following scenario:

The drive just gives me a boot error when using the Atari (which
doesn't tell me much)
However.....

When I talk to it directly using the PSIO cable (Parallel SIO interface)
and my PSIOX software (which works fine with my Trak drive)
it responds to a status request okay, but whatever sector I try to
read, I get a NAK as a response for. Oh, also the status response that
came back told me the drive wasn't ready. The microswitch for the door
does work, by the way. In fact, when you close the door, the head seeks
and recalibrates itself properly (I even verified this by manually blocking
the track 0 sensor, and it caused the head to instantly stop.. so that
all works)

So, if the motor spins and the head seeks why would it tell me the
drive isn't ready and give me a NAK?
(I thought that only happened when the sectors was out of range...)

Any help would be greatly appreciated. Also, since I don't have access
to any more 1050's, are any of those chips available from standard
electronics parts suppliers?

Thanks
- Frank

(feb6399@ultb.isc.rit.edu)

p.s. please send me email too if possible, since I might be out of town
for the rest of this week and my local news tends to disappear rather
rapidly.

It's almost rule #1 in the Atari 8-bit area not to try to apply the same standard for the 8-bit that you do with a 50+mhz 32-bit archetecture. Do you really think the 8-bit can do anything you can't do with that much brute force available on the PC? With that aside, it's still a fact that PCXformer is still unfinished and I personally have doubts it will ever run perfectly due to the vastly different (and in some ways worse) graphics system on the PC.

>:) John Harris said he too thinks the flicker is a PAL thing. Maybe
>he'll manage to disassemble it and patch it for NTSC and if that's what
>you didn't like, it will run smoother.

Just to clarify, the flicker is most likely caused by the NTSC machines having less CPU time available per frame, (1/60 vs 1/50 second), and the routine may not be executing to completion. To get it to run clean, it would most likely have to reduce the maximum number of vectors/points it was able to process.

I'm not planning on doing any disassembly of the 3D stuff, and would likely have a tough time doing so, since I haven't written any routines of that type. Though, I admit I'd love to have a usable copy of them to be used for some type of game engine.

In fact, I've always been a bit disturbed by the amount of time Europeans put into making demos. I'd sure like to see games, or something else useful be generated by these obviously great coders.

John Harris - jharris@cup.portal.com

4786. Re: Intel Demo and other stuff (MyDOS)

I didn't think much of their effort to map the bitmap pics onto the 3D objects. Since the 6502 doesn't have the power to do the image warping in real time, those pistures aren't going to look very good.

And yet, I would really like to see the same algorithm used with a much simpler repeating pattern or texture. That might look a lot better. The right image on mice 3D object could look very impressive indeed.

Won't work. The ingenious Atari engeneers (or maybe it was the marketing) wanted
a) to create a more serious 'PC' image of the 1200XL
b) spare the costs of an additional latch
So they used the then unused 8 bits of port 3&4 for memory management purposes like ROM enabling (RAM bank switching on the 130 XE)
So you will have to play MULE with 2 sticks or try to find an old 400/800 with four ports.

: rear extension slot. Has anybody done this?

I don't think it's possible. The memory locations for
the 3rd and 4th ports (aka PORTB) are used for accessing
the extra memory of the XLs.

If software reads ports 3/4, you get copies of 1/2.

: Joern

: P.S. Guess which game I want to play..

Basketball? Breakout (8 player!)? Survivor? Silicon Warrior?
Decathlon? Asteroids (y'know, that'd be cool).

Of course you mean the one true game! Mazewar. (I know, I know,
MULE... but there were several 4 player games :)

Source record: 98872

Well, I've learned that a new power-supply would run me $25. A bit of
a shock for me--nostalgia shouldn't be quite so expensive!! But as a new "Pac
Man" owner, I'm compelled to continue my search.
Does anyone out there own a power supply that they don't need? I'd be
willing to pay $10 or so plus shipping.
I'd really like to know how to rig one, though. I've done it with
a DC Power Box and some wire before, but the picture was pretty grainy. Does
anyone know how to use a normal DC power supply and hook it up to an Atari?
I'd be VERY grateful for directions...

Yes, the best way to have gone with upgraded memory (the real reason they got rid of the other 2 joysticks was to use PortB for banking, even in a 1200XL you can bank the under the OS memory with Port B I believe) would have been to simly stack a PIA on and map that in. But they copied the Bucholz upgrade mapping and the rest is history. It's essentially the formalization of a hack and we've been paying for it ever since due to the lack of available bits.

4795. Re: Four Joysticks

As for changing file formats from SPARTADOS to ATARI DOS 2.5.
Well, you can always upload to a BBS with one DOS and then
download with the other DOS. While this won't work with files that are
specifically compiled expecting a SPARTADOS layout, it does work for a
lot of things.

As for FTP-ing from UMICH, that doesn't seem to work anymore. You may
want to try and GOPHER a bit instead. Novices seem to be able to GOPHER
much faster than they can FTP. As a result, the GOPHER ports aren't
tied up for nearly as long as the FTP user ports are.

For all of you who can't seem to get on the Atari Archive, try amiga.archive.umich.edu or msdos.archive.umich.edu, then just go to the atari section instead. They aren't as busy, I just tried them both and got on the first try each time.

Jody Lenn

The xl only need a 5v power supply. The pin out for the jack is in
the FAQ & I've found the old Coleco power supplies you can find at
Radio Shack will just do it. Last time I bought one was years ago, but
I think it was only $4.95

4810. Sio2pc Help (slow writes)

Newsgroup: comp.sys.atari.8bit
Date: 1994-08-20 22:34:57 UTC
From: gnielsen@clam.rutgers.edu
Message-ID: <Aug.20.18.34.57.1994.10917@clam.rutgers.edu>
Source record: 98889

Hello,

I am having trouble with my newly built Sio2pc cable and I wanted
to see if anyone has a suggestion or answer. The problem is that when
I try to format or write to sio virtual disks the writes are VERY slow
(slower than a real atari drive) and normal the copy aborts with a
error-160. The atari boots fine from Sio2pc and the reading is great.
I have tried Atari DOS 2.5 and the MYDOS 4.5 that came with Sio2pc.

The copy normal write about 4-5 sectors quickly then slows down to
about a sector every 2 seconds. Disk formats almost never work. I have
tried this with just the plan Jane 720 single density disks. The last
kicker is that I have a program that does sector by sector disk
copies, (on the Atari). That program works great, both reading and
writting to normal or virtual disks. I am using sio2pc 3.18i

Thanks for help

Garth C. Nielsen

Well, I now know that the Atari uses +5VDC and ground. (I knew that before :(...)
Two question:

1) How is shield hooked up?
2) What kind of amperage does the Atari need? (If I get it wrong, what will happen?)

Amps for a stock machine wouldn't need more than 1.5. If you run dongles off it that draw power from it (like a lot of SIO ones do) and/or if you put a large memory uprade into it, you should have at least 2 amps if not more. That's why a lot of hard drive 8-bitters run a line from the clone supply (which is compatible) since that supply has tons of Amps to spare.

Wes Newell tells me that the Atari 800/1200 bricks are different and that they will have enough power to deliver a 1 megabyte 1200. I haven't tested it beyond 256K though....

I don't know what the different between AC and DC is as far as AMPS are concenred....

4813. Atari XE Group BBS info

Newsgroup: comp.sys.atari.8bit
Date: 1994-08-21 04:19:18 UTC
From: ba930@FreeNet.Carleton.CA
Message-ID: <CuvAo6.BEu@freenet.carleton.ca>
Source record: 98892

I noticed when I went through the info for the Atari XE Group BBS, my name was posted as being the SysOp. This may have confused someone because it happens to be in my basement and I often chat with users on there. But in fact my dad (Dave Brown,
AKA Digital Dave) is the SysOp. We have 40 megs of files on line and here's the other info...

Number: (613)225-2896
Location: Nepean, Ont.
Special stuff: On-line games, 8-bit files available for downloading, or you could even contribute and UPLOAD a file or two or three, IBM users are welcome, FileMail is available and E-mailing, 10 message bases(limited for non-members(ie. a few areas not
available to people who are not a part of the club)
Megs Online: 40 megs
Max baud: 2400

One more
thing...if you have CGS colour, or IBM colour ANSI, we support all that fancy stuff(in CoLoUr!!). File protocols available are: CRC-Xmodem, Standard X-modem, L-modem, Y-modem batch, 1K X-modem, F-modem and that's about it. Inform ya later if there's
anything I missed. Hope to see ya around, since I'm new here.

I have the following items for sale:

1 stock 130XE with power supply - $65
2 Percom AT-88 180K DD Drives - $25 each
2 stock 800XLs with power supply - $45 each
1 Atari 400 with 48K and regular keyboard with P/S - $35
1 256K ICD MIO with instructions and P/S - $85
1 Atari XM301 300 Baud modem complete in orig box! - $10
1 RANA 1000 DD Drive in orig box with P/S - $35
1 Atari TRAKBALL controller - $7
2 Commodore 1802 Monitors with split Luma/Chroma video - $65 each
1 stock Atari 1050 Disk Drive with P/S - $40
1 320K 130XE with OMNI OS and P/S - $85
1 Epson 9-pin dot matrix Printer with new ribbon - $35

You pay shipping.

4816. Re: 65816 /32 info

Newsgroup: comp.sys.atari.8bit
Date: 1994-08-21 06:53:31 UTC
From: Lonnie McClure <lmcclure@delphi.com>
Message-ID: <RM5TlMz.lmcclure@delphi.com>
Source record: 98895

In a message dated 8-9-94, Rick Michael Cortese said:

"The latest versions of the 65816 run at 10 MHz I believe &..."

Up until this month, that was the fastest rated version WDC produced.
65816's rated for 14Mhz operation are supposed to be available now.

"To get a 65816 up to speed it's going to need cache ram
which is beyond my limited abilities."

Since the "main" Atari 8-bit RAM is only 64K, perhaps a simpler to
implement shadow RAM scheme could be used. Both accelerators that were
available in the U.S. in the past for the Commodore 64 (one 65816 based,
the other 65C02 based) used this approach.

Also, if anyone cared to reverse engineer the cache design used on
the Transwarp GS and adapt it to the the Atari 8-bits, I doubt a lawsuit
would result, since AE is out of business. <grin>

4817. Re: 65816 /32 info

Newsgroup: comp.sys.atari.8bit
Date: 1994-08-21 06:55:09 UTC
From: Lonnie McClure <lmcclure@delphi.com>
Message-ID: <Rs5T181.lmcclure@delphi.com>
Source record: 98896

In a message dated 8-9-94, John Harris said:

"The 65816 can go to 16 MHz I think."

14Mhz is currently the top rating available on 65816's from WDC. Other parties are evidently licensed to manufacture the 65816, but I expect the fastest versions still come from Western Design Center.

Of course, most CPU's are conservatively rated. Motorola CPU's, for example, and routinely be pushed up 25% beyond their rated speed with no problems, as can some Intel CPUs (with their current "leading edge" CPU at any given time excepted). From what I gather, however, the higher speed 65816's have traditionally been rated close to spec. If the 14Mhz version follows this same path, 16Mhz would probably work, but I for one would be more hesitant in pushing a 14Mhz 65816 than a 16Mhz 68HC000 to 20Mhz.

"While an 816 CPU might easily run at 8 MHz, the custom Atari
chips are still going to have to run at 1.79, creating a
dual-speed machine where you will only get the fast speed
when using memory outside the base 64K where the custom
chips reside."

This is almost certainly the most simple and least expensive approach. Unfortunately, as you later mentioned in your message, this gives little benefit to existing 8-bit applications. For that, one can either use a cache scheme, which is perhaps the most flexible, but most expensive (from an R&D standpoint) or a shadow RAM setup (less expensive on the R&D end, but potentially more expensive in hardware).

A cache setup would have the advantage of boosting all memory, including any non-banked "65816-only" RAM. After all, a 14Mhz 65816 would require VERY fast memory to allow full speed access (i.e., below 40ns), which is out of the range of common DRAM chips. Large quantities of high-speed SRAM can certainly get expensive. <grin>

The problem with a shadow RAM setup is the standard of using banked RAM on the Atari, meaning either the full banked amount would have to be shadowed (more expense), or performance of banked applications could suffer. 64K of high speed SRAM is not a bank breaker, but to duplicate the size of many 256K banked RAM expansions would result in a four-fold increase in cost. Also, there is the problem again of DRAM that would be used for large 65816-specific memory expansions being too slow for the higher speed 65816's. Interleaving this memory would assist somewhat, but depending on the speed differential, can be less effective than a good cache.

A question: Does the ANTIC actually halt the CPU during any acesses, or just under certain conditions? (From what I know, the "halt" function is one of the main differences between the XE/XL "Sally" custom 6502 and a standard 6502). If it does indeed halt the CPU during any accesses (i.e., reading display data and refresh cycles), it might be possible to replace the main RAM with faster rated RAM, and ramp up the clock speed with a separate clock to the CPU. However, even if this scheme worked, one would still have the problem of interfacing with the support chips, which are used to 1.79Mhz speeds, and likely would not tolerate even 3Mhz. Even in this case, there would still need to be a function to drop the CPU speed when accessing areas of memory known to be used for non-RAM purposes.

When all is said and done, a cache appears to be the best overall approach, but sadly may be beyond the resources (engineering knowledge and/or financial) of the Atari 8-bit community.

4818. Re: 65816 /32 info

Newsgroup: comp.sys.atari.8bit
Date: 1994-08-21 06:56:35 UTC
From: Lonnie McClure <lmcclure@delphi.com>
Message-ID: <Ruywdqz.lmcclure@delphi.com>
Source record: 98897

In a message dated 8-10-94, John Harris said:

"That being said, an ANTIC/GTIA at twice the bandwidth
would be able to do 2 colors at 640x200, 4 colors at 320x200,
16 colors at 160x200, and also 4 color players. That would
be pretty useful, and not make a major impact on RAM speeds
and costs. I wish Atari would have done it."

Actually, they could have done it without increasing memory speed requirements at all; by doubling the width of the data path. This is half of the approach Commodore used with the AGA chipset, and part of the way Tandy jumped from 256x192 screens with few colors on the Color Computer 2 and prior, to 320x192 16-color screens (and 4-color 640x192) on the Color Computer 3. Perhaps the Tandy example is closer to what Atari could have accomplished, as the CPU remained the same 8-bit unit (the 6809).

Of course, while I had a few ideas pop up such as twin ANTIC/GTIA's in one machine, each accessing separate banks of memory, for expanding color resolution, and possibly on offset clocks in an attempt to increase actual resolution, such approaches are kludgy and ill-advised. The time spent on engineering such approaches would be better spent augmenting the current ANTIC and GTIA with a more modern VDP, preferably one not tied to a specific CPU clock speed. After all, in either the "kludge" case, or that of a totally new, but seconday CPU, old software would still run, but new software would need to be written to make use of the new display capabilities.

It is a tribute to the design of the Atari 8-bit's chipset that it lastest as long as it did in the "active" market, with no update or real augmentation. Of all its contemporaries, it has the oldest chipset design, save for the Apple II, which went through two significant upgrades, the first being the 64K aux board of the Apple IIe, which opened up an "official" 80-column standard and double hi-res, but later the larger upgrade that came in the form of the graphics chip on the IIgs. In Commodore's case, the VIC-II found in the 64 was augmented by the 8563 in the C-128. (There was also the much more capable VIC-III found in the C-65, but since it was never marketed, I am not certain it can be counted). In the case of the Tandy Color Computer, the third version brought a total revamp of graphics capability. Oddly enough, even the graphics capability of the TI-99/4A can be upgraded. Odd, because the first chip to make this possible came out about two years *after* TI quit selling the machine!

Source record: 98898

In a message dated 8-17-94, John Perez said:

"From what I can tell, the double sided, double density
format from DOS XE is not compatible with anything else"

If you have the capability to download to your 130XE, I strongly suggest getting ahold of MYDOS or or latest version of SpartaDOS (now shareware).

If you do not have download capability for your 8-bit, perhaps someone can mail you a copy of either or both DOS's. Of course, you could always obtain SpartaDOS directly from FTe (and just pay the shareware fee in advance). I am not certain whether MYDOS is shareware or freeware, but I would imagine similar arrangements could be made in either case.

Message-ID: <KUBLA.94Aug21110228@kingluey.zdv.Uni-Mainz.DE>
Source record: 98902

```
PORT B is now used for MMU purposes:

400XL/800XL/1200XL
------------------------
Enabling the OS-ROM
Enabling the BASIC-ROM
Enabling the MATHPAK-ROM
Enabling the SELFTEST-ROM

130XE
---------------------------
Enabling the extended RAM and bankswitching.

XEGS
----------------------------
Enabling the internal game cartridge (forgot what it has been ...)

The easiest way to support your external hardware is to put a PIO on a small
board which will plug into the extension port. If you put ROM on it with the
right MAGIC number on the right address your XL will recognize it at boot time
and plug the driver into the OS. Great, isn't it? It took intel 10 years to
implement something like that for the PC!

Cheers,
Dominik

What part of the demo was the Plasma thing you guys are talking about?

Just because they used that 896 point animation system to create a scroller, doesn't mean that's all it can do. It could move any object(s) made up of those points. There is likely to be some use for it where it would be better/faster than some other routine. If the scaling and rotation is hard-wired and table driven, that would limit its uses though.

>40ns)...

Is that 40ns figure correct? Is the bus access on the 65816 different from 68000 designs, since 80ns chip are good enough for 25MHz in 68030?

I would guess even the simplest 65816 designs would be at the financial limit of feasibility for the Atari 8. I think cache, even though benefitial, would cross that line.

>A question: Does the ANTIC actually halt the CPU during any acesses, or
>just under certain conditions?

The CPU is halted on any ANTIC accesses to RAM. Including all byte fetches, and memory refresh. This is another benefit to a second memory bus for expanded 65816 memory. Not only can it run at a faster clock, but it can be immune to ANTIC DMA.

You are write about M.U.L.E.'s cult status...

It is almost always included on any top ten list of favorite classic games. It was especially great playing it with the old 800 and its four joystick ports, even though I have heard of a hacked 4-player version for the XL in which the 1 and 3 and 2 and 4 players are switched in. Otherwise, you are limited to a maximum of two players on the XL machines.

The game came out in 1983 and is outstanding!

M.U.L.E. stands for Multiple Use Labor Element and the games takes place on the planet of Irata or Atari spelled backwards ;)

It is a game in which up to four players attempt to settle a distant planet with the help of a mule-like machine that everyone learns to hate! but absolutely needs.

You are a planet pioneer and need your M.U.L.E. to mine, farm, haul stuff around, but if you mistreat it, the MULE likes to run away.

The game centers on the exploration and resource development of this planet called Irata. In the basic game, you choose a character, and start with $1000 in money and $300 in Food and Energy. You select a plot of land via a Land Grant each turn. You then decide what you will do with your plot of land - either mining, farming, or producing Energy depending on the type of plot. You then have to outfit your MULE and then install the MULE on one of your plots of land.

There is a store where you can buy and sell. You can trade, transfer MULEs, go to the pub and try to win more money, mine for crystite underground in the Tournament version, or enter into Collusion with another player.

Prices are set by the law of supply and demand. The game also involves economies of scale, the applied theory of production, and most importantly, the Prisoner's Dilemma. That is, in the game of MULE EVERYONE loses if the colony doesn't survive. It is a great game, and was distributed by Electronic Arts, when a good game was considered an art form. Sadly, once can't say that about most of today's games.

You might be able to still get it from B&C Computervisions in California. That is where I got mine.

M.U.L.E. is a 4 player planetary settling/trading game that basically uses the simple laws of free enterprize to turn 4 people violently against each other in the span of about 45 minutes. Once you play it, you'll know what someone means who says "they don't make games like they used to."

M.U.L.E. (Multiple Use Labor Element) was written by Ozark Softscape and sold by Electronic Arts.

There was an old game for the Atari 800 called Way-Out that I'd like to get a copy of. The disk we have finally went kaput. It was essentially a 3D maze game, but you were chased/chasing this thing called a "kleptangle" that would steal things from you. Also, at certain points in the game there would be wind that would prevent you from going certain places. If anyone has a copy of this that I could buy/copy/whatever I'd appreciate it. (BTW - we *have* a legal copy, but I don't think the company that made it (don't remember the name) is in business any more.)

Well, that IIGS accelerator had more parts on it then two Ataris <g>.
My original scheme for auto switching speeds fell flat on it's face.
I tried using the !HALT line to switch a <Parts numbers may vary due to
faulty memory circuits> 74ls157 from the 3.59 to 4.0 clock source &
the thing crashed immediately. I'm hoping against hope that what
happened was the extra ttl load was enough to jinx the signals. Reason
why I have hope is because the existing design works with just a toggle
switch: No debounce or ANYTHING. I thought if I could get away with that,
I could do the !HAULT thing. Quick trip to various parts stores to pick
up a bunch of HCT, HC, C devices but I got busy with work. I also started
working on a picking the sync info off the Antic & sending it through
a 4528 to regenerate proper width sync signals. Too many things going
at once in order to make one thing, faster clock, work in a manner that
people would find acceptable. As some other stuff hits the streets, like
the simm memory upgrade, we'll have faster ram to work with. For the
current stuff all I did was go out & buy a broken clone mother board
that had 100 nsec 256k chips in it. If the computer doesn't work
at a clock rate faster then about 20% over stock I'll probably just
abandon it as not viable. There's a lot of stuff I haven't tried, like
copying the OS ROM to RAM before doing the speed change, but I don't
think I'm going to put much more effort in it. Work for me gets back to
merely a "killer" pace after next weekend so I'll have more time for
jerking around.

"MATHPAK-ROM"?!?!?!

Hmmm!?

-bill
kendrick@vax.sonoma.edu ||| kendrick@zippy.sonoma.edu
William (Bill) Kendrick / | \ ** New Breed Software **

YEP. That's the way it is called in my documentation. Let's
have a look at the memory map:

```
0000+-----------------+
| |
| RAM |
| |
4000| - - - - - - - - |
| |
| RAM |
| |
8000| - - - - - - - - +---------------+
| | Modul A |
A000| - - - - - - - - +---------------+---------------+
| | Modul B | ROM-BASIC |
C000|-----------------+---------------+---------------+
| OS-ROM (XL/XE) | RAM (XL/XE) |
D000|-----------------+---------------+
| I/O - Ports |
D800|-----------------+---------------+---------------+
| MATHPAK-ROM | | Exp.bus-ROM |
E000|-----------------+ RAM +---------------+
| | (XL/XE) |
| OS/ROM | |
+-----------------+---------------+
```

So you see that the XL/XE systems have a rather
sophisticated memory management. Anyway the so-called
MATHPAK-ROM was seperated from the OS-ROM, because
the parallelbus initialization was pulling address
lines and checking in that area for expansion-rom
signatures to find out whether there might be a device
to be initialized ...

Maybe the MATHPAK was known under a different name in
the states ?

Cheers,
Dominik

I have an Atari 800 for sale. It's been so long since I've used it that I don't recall the model and a lot of other particulars. However, I had just about everything you could have for this machine when I stopped using it sometime back in the mid-1980's. It's been stored ever since -- still packed in its ORIGINAL CARTON!

Some stuff I _do_ remember: Had max RAM and many programmers tools including a switch installed to flip it into debugger mode. Had Assembler Cartridge along with some other carts for games, etc. I will sell it with everything I have for it including Percom Master and Slave floppy drives (about $1000 total when I bought 'em), Koala digitizing pad, joysticks, MANY MANY MANY pieces of software (hundreds of disks would not be exaggerating), Tape recorder/player along with software on cassettes.

Much documentation for all of the stuff I have. I kept EVERYTHING, most of it in original packaging. You will get 3-5 LARGE boxes of stuff. Some products never opened. Anyone running an archive or museum?

Please contact me by EMAIL ONLY! at cjkulas@townsend.com and make an offer. I hate ads that ask for an offer but I really have no idea what this stuff is worth. I am located in San Francisco.

For whatever it's worth to the hardware hacker types, I believe
the 6520 is the same as a 6820, which is not _quite_ the same as a
6821. Functionally the same, but as i recall (data sheets being
home), the 6821 has active pullups which tristate 100 percent,
whereas the 6820 has either resistive or current sourcing pullups
which part of which are always active, even on input. IE - the
6820 needs no resistive pullup as an input device, the 6821 does,
for a simple switch type input.

According to the IBM Technical reference, copyright 1983, this
feature is clearly spelled out. I know it was around as long as
the XT BIOS was around, as that is how the hard drive driver
installed itself. Pre XT, perhaps not a feature of the bios.

It ought to be possible to create a peripheral device that could plug into either SIO or the two existing joystick ports of the XL, and could accept four joysticks (or any number of any kind of controllers) and "multiplex" the information into the XL in some way. The device would have to "speak" to a driver that knew what was going on and faked the proper values into the RAM shadow locations, and you'd then have to redirect the joystick-examination code of existing programs to look at the RAM shadows exclusively (since the hardware registers alone would no longer be the definitive source of joystick information). All of this would "take some doing," but I see no real reason for it to be considered "impossible." (Heck -- you could probably modify SIO2PC to do this kind of thing.)

Cross-posted to: comp.sys.atari.8bit,ny.forsale,misc.forsale

My Atari days are over,

After holding onto, and keeping this thing for who knows how long,
I'm finally getting rid of my old Atari 8-bit system. It's just
sitting around in my place not being used, so I figure, why not
sell it to someone who can actually use it.
I've taken very good care of this system, and for the most
part, it's a mint condition setup. The only thing that makes it
less than "mint" is the fact that I can't guarantee that all of the
software that it comes with works. Some of these disks are over 10
years old you know. But the last time I used it, everything worked
fine.

$150.00 CASH AND CARRY IN BROOKLYN, NEW YORK ONLY.

E-MAIL ALL OFFERS, COMMENTS AND QUESTIONS TO (JIS@PANIX.COM).

ATARI 800XL: Unmodified. New keyboard put in about a year ago.
Includes power supply, video cable, game/TV switch
and owners guide.

ATARI 1050
DISK DRIVE: U.S. Doubler installed. New drive mechanism
installed about a year ago. Includes power supply,
serial cable, owner's guide, DOS 3.0/2.5 manuals.

ATARI 410
CASSETTE
DRIVE: The original tape drive that came out when the 800
and 400 were first released. I had to re-solder a
few wires, but it still works and actually comes in
it's original packaging

ATARILAB: Starter set and light module. Complete and never
used in original box with cartridges, manuals and
everything.

GAME CONT-
ROLLERS: Atari Trac-Ball, Tac-2 Joystick and Quick-Shot
Joystick.

CARTRIDGES: Atlantis, Star Wars: The Arcade Game, Missile
Command, Asteroids, Pac Man, Centipede, E.T. Phone
Home, K-Razy Antiks and K-Razy Kritters. No
documentation on any of these.

CASSETTES: Space Invaders, Moonbase IO, Hazard Run, Jaw Breaker, Blue Max, Shamus, Shamus II, Fort Apocalypse, Protector, Megalegs, Pirate Adventure, Angle Worms, Action Quest, Canyon Climber, Pacific Coast Highway, Astro Chase, Preppie and Preppie II. No documentation on any of the above cassettes, except for Preppie II.

DISKS: Seven Cities of Gold, Movie Maker, Mail Order Monsters, 221B Baker Street, The Pawn, Gauntlet, Ace of Aces and Computer Ambush. All of these disks come in their original packaging with documentation.

MORE DISKS: I also have over ten boxes of disks (about 15 disks per box) filled with software, games and utilities. All undocumented.

$150.00 CASH AND CARRY IN BROOKLYN, NEW YORK ONLY.

Not much luck for digital video (although you can KINDA do it) but for analog RGB multisyncs you can get monitors that sync down to 15khz and have composite inputs. However, ALL of these monitors do not also support split video, composite is rare as it is. The only RGB monitor that takes RGB, composite, and split, is the C= 1080 series and it isn't multisync. It's just a glorified 17, 18, 1902.

The demand for NTSC monitors will increase in the next year IMHO because of the evolution of console game machines that routinely will use 640x400 reslution (the effective limit of standard NTSC) and these consoles, 3do, Jaguar, and I assume also the CD^32, have high-quality signals for composite and RGB, not just RF like the days of yore.

Whether this creates more 15khz analog monitors is still iffy, but I'm hoping so because multisyncs are way too expensive ant 1080s are aging.

You have to use the ASSAY office to find crystite. Usually crystite is found in a pattern of HIGH crystite surrounded by MEDIUM crystite on 4 sides and LOW beyond that. The exception is when a meteorite hits leaving a new HIGH crystite deposit. Crystite is not used by the colony so I'm not quite sure how its value fluctuates.

Not at this time, but my roommate is working on building an 8-bit to RGB adapter, that will let you use an Atari SC1224 or any other monitor that does 15 kHz. It'll look WAY better than even Super Video 2.1 on a monitor with separate chrome and luma (like the 1702). I've seen a preliminary version and it looks GOOD. He hopes to have it out in a month or two.

Half naked and half sedated, MATTHIAS BELITZ ran through the streets
screaming something about "Spartados...."

MB>Is here anyone wanting to tell me why Spartados X is MS-Dos-command
MB>compatible and Spartados 3.2F has its own commands ?

Yes. SDX's is the superior interface. And most (if not all) 3.2
commands are still supported.

MB>Does there exist any programm to translate files from
MB>Spartados-disk-format
MB>to Dos 2.5 or Dos 3.0 format ?

MB>Where can I get it ?

It's part of the DOS. It's called COPY. Write to an Atari DOS 2
formatted disk. (With SDX, make sure DEVICE ATARIDOS is in your
CONFIG.SYS; you don't have to worry about it with 3.2.)

Thanks, to Ivo van Poorten for the description of the scroller.

I'd also like to retract, or at least alter the comments I made about demo coding. It was short-sighted to not realize that some users enjoy watching the demos as much as I like playing well programmed games. As a game programmer at heart, I look at demos and mostly see what those routines could have been used for in a game environment.

Even more important, it was pointed out that keeping the programming experiance fun, is one of the design goals of demos. That's something I can surely relate to, and agree with.

John Harris - jharris@cup.portal.com

4867. Re: 65816 /32 info

Newsgroup: comp.sys.atari.8bit
Date: 1994-08-24 12:44:15 UTC
From: Lonnie McClure <lmcclure@delphi.com>
Message-ID: <Z81QdHf.lmcclure@delphi.com>
Source record: 98746

In a message dated 8-21-94, John Harris said:

"Is that 40ns figure correct? Is the bus access on the
65816 different from 68000 designs, since 80ns chip are
good enough for 25MHz in 68030?"

It was a ballpark figure, based on the fact that one 3.6Mhz 6502-based machine I was familiar with (the Laser 128/EX), required 120ns chips. Given a 65C816 at close to 4x the clock speed (14Mhz), a 3x increase in the chip speed of the RAM seemed a conservative estimate. If one looks at the cache RAM on the 65816 accelerators for the Apple IIgs (the fastest production version of which was a "mere" 9Mhz), you will find the SRAM cache certified for speeds faster than that.

According to a text I have on upgrading the AE TransWarpGS for faster operations, it mentions 35ns is apparently "sufficient" for 12.5Mhz. (Evidently this is the speed the TWGS shipped with).

For further consideration, the Tandy Color Computer 3, which runs a 6809 (an offshoot from the early 6800, as the 6502 was) at less than 2Mhz, will sometimes fail to operate properly with some 150ns chips, and thus 120ns chips are recommended. (I have heard the actual requirement is around 137-138ns, but of course, chips are not made at that particular speed rating). <grin>

Compare this to the 8Mhz 68000 in the ST's, which was quite happy with 150ns RAM, and from stories I heard more than one, 170ns RAM in some Mega ST's. (Though where they would have found 170ns, I have no idea).

Back to the 25Mhz 68030, I suspect it would be somewhat happier with 70ns RAM, and perhaps even 60ns. Somewhere buried in one of my collections of old Computer Shopper articles, I have a chart listing various processor speeds and the RAM speed required for 0 wait state operation in a non-cached, non-interleaved design. Although it was Intel oriented, I believe the 680x0 series was covered to some extent. I do recall that once you passed about 20Mhz, properly rated RAM for full speed became hard to come by. (However, 60ns RAM was virtually unheard of at that time, which was during the reign of the 80386. I expect a 25mhz is now the limit).

With all this said, keep in mind despite its banner as a 16-bit CPU, the 65C816 actually still has a data path of 8 bits. Therefore, if a 14Mhz 65816 required the same RAM speed as a 33Mhz 80386DX or 486, this would not mean its performance was the same. Strictly by that comparison, it would appear to be more on the order of a 16Mhz 80386SX,

or a 80386DX or perhaps 486 running at 8Mhz.

4868. Re: % XL -> MultiSync monitor?

Newsgroup: comp.sys.atari.8bit
Date: 1994-08-24 12:46:05 UTC
From: Lonnie McClure <lmcclure@delphi.com>
Message-ID: <Ze1Qt-d.lmcclure@delphi.com>
Source record: 98747

In a message dated 8-22-94, Oscar Fowler said:

"...and just got to wondering if there was any sort of
adapter which would allow me to take an 8bit's video
output and display it on a multisync-type PC monitor."

If you mean to connect to your typical RGB-only multisync, no, I know
of no ready-made adapter that performs composite-to-RGB analog
conversion. However, even if their were, I suspect the cost would
be as great as one could pick up a used composite color monitor for.

That said, there are some alternatives:

(1) Find one of the few multisyncs that supports composite input.
Unfortunately, about the only affordable one is an older model made
by Mitsibushi (model AUM-1381, I believe, but don't take my memory
of that number as gospel). Cost varies, but typically expect to
pay $150-$200.

(2) If you already have a PC and a multisync, buy one of those
TV-in-a-PC cards (not a video capture card) like "WinTV", and
use your Atari 8-bit as the input source into the card.
Cost: Likely $200-$300.

(3) Some color splitters meant for digitizing apparently have all
three components of RGB available internally. In fact, according
to the docs for my Rombo RGB unit, these are available on the
auxilliary connector, essentially making it a composite-to-RGB
convertor. However, I have yet to test this. Cost: $109 new,
plus cost of proper cabling.

(4) Make your own hack. If you multisync supports 15.75Khz horizontal,
there is a way to get an RGB signal out of the Atari 8-bit.
The caveat is that it would be TTL level (which can be reduced
with the application of resistors, if actually necessary), and
will correspond to the luminance levels of the graphics on screen,
not the actual colors. Get ahold of the December '93 issue of
"Atari Classics" for details. Cost: Whatever you have to pay to
get the back issue if you don't have it, the small costs for
materials, and your time. I once proposed an idea for getting
more colors out of this hack, and actually taking advantage of
RGB analog monitors (vs. RGBI, which it is really set up for),
but it went over like the proverbial lead balloon. <grin>

In a message dated 8-22-94, Glenn Saunders said:

"The demand for NTSC monitors will increase in the next year
IMHO because of the evolution of console game machines that
routinely will use 640x400 reslution"

I expect not, but rather that it will increase demand for A/V and S-video jacks on televisions, especially in the lower price ranges. (While some low end sets have A/V jacks, S-video still only seems to appear on $400-$500+ sets). Who knows, we might even see the return of RGB analog inputs to TV's. (I say 'return', as the Sony KV-1311R of almost ten years ago supported analog RGB, as well as composite).

It is too bad "component television" (for those old enough to remember it) never caught on. Most of the monitors used RGB analog connectors to the video tuner. Of course, this was high-end stuff, but had it proved popular, the standard would doubtlessly have spread across the price spectrum (and your VCR might sport 15.75Khz RGB analog I/O, even if it was still only NTSC resolution on the tape).

John; I always thought the 65xx series needed faster ram only because
of Page 0 access. A few other people have this same impression. I
think the 6502 is the only one of the processors that has this
feature => your average 68xxx can use twice the clock speed for
any given ram speed. The 80xxx series use so many clock cycles
for a given memory access cycle they really don't need anything
nearly as fast as the 65xx, 68xx. If the assumption is correct some
of your estimates of cost are a little high, but ballpark. You
wouldn't need 128 or 256k of sram, only maybe 4-16k to take up
the lower memory area. That would still allow you to relocate
page zero in a couple of slots like page 6 (this is a feature of
the 65816 right?) but you could use standard 70 nsec simms for the
rest of the memory map. The added complexity of decoding sram vs
ram would add a couple of chips & maybe even limit the clock do
to propagation delays through the added gates, but it should be
an achievable goal.
Rick

4879. Re: Intel Demo and other stuff (MyDOS)

Newsgroup: comp.sys.atari.8bit
Date: 1994-08-24 20:39:16 UTC
From: kendrick@zippy.sonoma.edu
Message-ID: <33gb5k$ehh@nic-nac.CSU.net>
Source record: 98807

The Intel Outside Demo was released by Our5oft sometime early this year (it was coded mostly in 1992, so say the scrollers). It seems to run ok on an 800xl with 64k or compatible (ie, 65xe, 130xe, 1200xl, xegs, upgraded 600xl, etc.). At least on NTSC machines, it seems to get stuck in the middle of the third demo (with the wavy dots), but you can easily get to any of the other parts by loading them with a mini boot-sector loader (like Chaos Loader) or even with MyDOS!

Side B (Double-Density) includes about 6 ".MD8" files and a very nice MD8 player. (Anyone know where to get other MD8 files? I'm gonna look at the Fampy DCM files to see if there are any more and if they work with SoundTracker 3.0 (the player on the Intel Outside Demo side B))

Later!

Re: BILLSCRM.GIF

No, that's not my PC.. I only had my 1200xl's back then. That's one of the (25 or so) 486 clones at my old high school.

Speaking of HAM, could some HAMish routine (fitting colors in that type of graphics mode.. that's the DLI-type mode on the Amiga, right???) let us 8bitters convert, say, 16-color (Anime or cartoon) GIFs into like RAMBrandt style files?

Hmmmmmmmmmmmm

YAY!!!!!!!!!!!!!!!! MORE COOL (hopefully) DEMOS!

I just got the following files from Tamas Bene of Hard Software:

PARTRO.DCM - I forget the name of it
RAYOFHOP.DCM - Ray Of Hope Demo
SWEETA.DCM - Shadow-something (?) demo...
SWEETB.DCM - part2

I can't test them because I'm at school right now, but I will FTP them to
UMICH as soon as I can stinking login! :)

> : hand!
>
> Clay has moved to Korea I believe since he's in th military. He hopes to
> find a way to telecommunicate while there. We'll see.

Hmm.. I, too have moved. Not to Korea though.. Still in Jerusalem (hey,
which of these are more "nowhere"-like?).

My 8bit is all crapped up. I have no way to read my Ice-T disk with the
sources, because my Rana stopped working, and my Indus.. well, the Indus
is Ok... in single density.

I bought an SIO2PC, but my PC is acting really, really weird lately.
Destructive, too. I thought it was a virus, but the latest version of
McAfee's Scan couldn't find anything.

This seems to have started since I got my sio2pc. Either the hardware craps
up my system, or the software disk I got had a new and unidentified virus..
I dunno. Anyway, when I get a system that WORKS, Ice-T will be coming soon.
If not, well.. Not, I guess.

So I just sit and listen to Phish.
"this isn't who it was if it wasn't who it is"

Source record: 98824

In Article <33brgs$ale@blackice.winternet.com>
sydtech@winternet.com (Scott Butler) writes:
>I found this in a huge stack of old disks that had been rotting away
>since the early 80s. I've gotten the hang of it, with the exception of
>one thing: how does mining for crystite work? How do you survey for
>crystite?
>
>Thanx,
>Scott

You go to the plot of ground and get a sample and take it back to have it analyzed. If you don't get a good analysis, don't bother to mine for crystite. Also, the crystite runs in certain areas, so if the plot of ground next to yours has crystite, your plot may have it too. Don't forget, you can move your mules around to maximize your production.

HELP - I have had the C64 version of M.U.L.E. for years, but have never seen the Atari version. Does anybody know where I can get a copy for the 800? I can't currently FTP to my Atari so I would have to send you a disk.

Thanks,

Bob

PS - watch out for the mooserats!

$80???? Ack! Thanks, but I think I'll just grab an old SCSI drive, like
a little 30-40 megger, which should be about half that. :)

Rob

4885. XE/XL games for sale

Newsgroup: comp.sys.atari.8bit
Date: 1994-08-24 23:46:09 UTC
From: dw901@cleveland.Freenet.Edu
Message-ID: <33gm41$8l1@usenet.INS.CWRU.Edu>
Source record: 98811

Well, maybe for sale! I found a store selling BRAND NEW copies of two games for use on the XE/XL computers. They are Ballblazer and Hardball, both are cartridge games, and they are shrinkwrapped.

What I want to know is, is anyone interested? And if so, what are they worth to you. Buyer would have to pay shipping, so consider this in any offers. If enough people respond, I can pick them all up. There were about 10 copies of each game.

Mike

4886. Atari 8-bit/2600/7800 software FOR SALE

Newsgroup: comp.sys.atari.8bit
Date: 1994-08-25 00:50:17 UTC
From: Lawrence Estep <71450.1050@CompuServe.COM>
Message-ID: <33gps9$h5k$5@mhadg.inhouse.compuserve.com>
Source record: 98817
Cross-posted to: comp.sys.atari.8bit,misc.forsale.computers.other,rec.games.video.classic,alt.games.video.classic

I have a MIO/256K version that is busted.
The Green power light is on, but the red access light refuses to 'flash'.
The MIO command runs and says its done its work, but the
<SEL><RESET>command does not bring up the MIO menu.

Is there a place that fixes busted MIOs? I'll dl the vendor FAQ (if not
M.Current expect some mail from me :))

Thanks muchly.

Source record: 98816

to determine the length of a cycle, take 1 over the number of cycles per second.

8MHz = 8000000 cycles/sec
1/8000000 = .000000125 seconds or 125ns per cycle

fortunatley, RAM is not used once per cycle on most CPUs, so the RAM can be slower with no real performance loss.

4891. Re: 65816 /32 info

Newsgroup: comp.sys.atari.8bit
Date: 1994-08-25 05:30:26 UTC
From: jharris@cup.portal.com
Message-ID: <120817@cup.portal.com>
Source record: 98818

I think I have the RAM speeds figured out. The 6502/65816 take only 1 cycle to access memory, whereas the 680x0 series designs take 4 cycles. Thus at a given clock speed, memory can be accessed much more frequently in the 6502/65816. 35ns for 12.5 MHz 65816 actually works out to 4 times faster than 70ns for 25MHz 68030, so it checks out. Although, it is standard in the Amiga world to only require 70ns when going to 33MHz speeds. As in your example, double the clock speed doesn't have to double the RAM speed, since not all of that clock is used to read memory.

Check out a file on the archive that is called, "8bitcat.arc".
It is a catalog of file descriptions. This may be what you are looking
for, but I do not know if it is frequently updated, or when the last
update was.

4893. Re:65816/32 info

John Harris wrote:
"Is that 40ns figure correct? Is the bus access on the 65816 different from
68000 designs ..."

Yes, it is different. The 68000 series uses for one bus access four cycles
while the 65xxx series does all work in only one cycle. So you can compare:
a 65816 with 10MHz = a 68000 with 40MHz (only in bus access!)

But the 68000 get 16 bits from the bus in one bus-cycle. The 65816 needs
two cycles to get this 16 bits. If you compare a 68000 and a 65816 with the
same clock-rate the 65816 is two times faster than the 68000 (to get one
word the 68000 needs four cycles and the 65816 needs only two cycles).

Higher CPU Speed stuff:

This time I'm working on an utility that can switch the old clock-rate
asynchronusly to any higher clock-rate. This high speed will be activated
in the above memory banks ($01000-Sffffff). If the CPU accesses to I/O chips
e.g. the higher clock-rate is switched back to the slow 1.79MHz.
This high-speed affects only the CPU! The rest of the system (ANTIC) runs
with the old speed.
The switching logic takes place in a GAL16V8 (there's no further hardware
expect an oszi for the higher clock-rate).
This time I've some trouble with this project :-)
but I'm working....

Z-modem doesn't exist for the Atari 8-bit, but there is L-Modem, Y-modem,
1K-Xmodem, and F-modem.(L-, Y-, and F-modem are all capable of batch
transfer). Check out the Atari 8-bit BBS to pick up copy of BobTerm v1.22,
which also supports XEP80 and SpartaDos(if modules are included in the
file).

Actually the 125 nsec figure is is just clock cycle time, not memory access access or machine cycle time or memory cycle time. Some of the microprocess, the one in the TI 99/4 comes to mind, used really fast systems clocks like 10MHz with slow cycle times. I could pull out some of my data books to check, but for the most part, if you look at the manufacturers data data sheets they will have a series of square wave signals representing the various signals of the microprocessor. For a 6502 you'll see something like 4 clock transitions total coming from the 01 & 02 clock lines. I believe an 8088 type system uses twice as many ticks of the clock to do the same thing ergo 150 nsec ram in an 8 MHz clone works fine. This is one of the reasons why we only have a maximum of 256 opcodes available to us should anybody stick a 65802 in their machine. The 8088 systems do much more with an instruction & have many more instructions available, but the overhead is there even with a NOP.

BRRRZZZT! WRONG! I'm sorry, how about a consolation prize, Chris! :)

Nope, Z-modem (download only) IS out for the Atari.. it's just an external program you load from DOS (jump to DOS from your terminal then load the downloader.. then you go back to DOS and back to the terminal.. I THINK.. I've never used it (no modem for the 8bit BECAUSE R:P:CONNECTION ISN'T OUT YET!!!!!!!! :) Sorry)

Anyways, it seems you need maybe 3 programs for the Atari just to be able to download! :) Kermit65 or some other kermit-capable terminal for kermit transfers, AtarZmodem for Zmodem download, and BobTerm for most other stuff..

When I boot this it loads up with the "loading" screen just like on side A but the title is screwed up and then it starts accessing weird sectors (I'm using SIO2PC).. it goes by like 200+ each time.. then it dies because it's trying to read past sector 1040.

Anyone else have problems with this demo (side B.. A works ok) ????

Also, what do you folks think of the other demos put up? I especially like the intro to Sweet Illusion (side A.. I can't get B to unDCM yet cuz of SIO2PC.. I >REALLY< NEED DCM2ATR!! SOMEONE MAKE IT! hehe) .. this is the one were the faces of the coders pop up on the right and bio-data is drawn on the left.. pretty cool.. would look good in a _game_ (hint hint hint)

YEAIH! I got Fampy 2.3 to run finally! (Well, not that I've been trying
EVER since I got it! :) .. it's just I figured "Fampy comes with MD8s! I can
listen to those with SoundTracker!" .. then out of curiosity I tried to run it
again and it works!)

Ok, here's the deal.. you make your two disk(side)'s from the FAMPY23.DCM and
FAMPY23B.DCM. You boot side A. Respond to the drive-type prompt with
START or SELECT.. from there, >HOLD SELECT<! The screen will go crazy for
a while (decompression I guess) and then you'll see the title flash on and off.
This is what normally makes our good old NTSC (or at least >MINE<) die (no
lockup that I remember, just a "no, you can't leave!" attitude).

More decompression happens (crazy colorful screen) then you see a screen
which has "D1:________.MD8" on it.. from here, read the docs!! :)
(Select selects a file, Start loads, Shift exits to title I guess..
File loads, press Start to hear, Select/Option to change speed, Shift to
return to loader screen.
Music plays (screen on! hey!) press Shift to return to player/loader screen.)

Have fun!

4911. XF551 problems (again)

Newsgroup: comp.sys.atari.8bit
Date: 1994-08-26 22:28:20 UTC
From: clisowsk@condor.mcs.kent.edu
Message-ID: <33lqa4$47j@ns.mcs.kent.edu>
Source record: 98841

It appears that I am subject to XF551 drive problems, again. This time,
it is a beast of a different nature. The drive works perfectly fine for
about 20 minutes or so. But any time after that, when attempting to read
any sector, it will return some of the proper data mixed with random data.
This appears to be a problem with the drive overheating. Previously, I
had to tempararily remove the heatsink to get in to check and replace a
few resistors, as well as hardwire some of the sio cable signals. Recently
after discovering this overheating problem, I have remounted the transistors
applying new heatsink compound (Silicone and Zinc Oxide). But, it appears
that the drive is still overheating. (sigh)
The drive does work fine if I keep a little fan cooling off the heatsink.
Does anyone have any suggestions for me? Is there a way to test transistors?
[Yes, the transistors do get remarkably hot. Hot enough to burn a few
fingers when the metal heat-sink is not mounted.]

The SIO signals that I have wired in are: Read, Write, Command, and 2 Grounds.

4912. Internet Access and the Military

Newsgroup: comp.sys.atari.8bit
Date: 1994-08-26 22:29:15 UTC
From: REASERRL@POST2.LAAFB.AF.MIL
Message-ID: <2E5CA7B9@POST0.LAAFB.AF.MIL>
Source record: 98840

Just as a point of reference, the grandfather of the Internet, ARPAnet, started out as a military project under the Department of Defense's Advanced Research Project Agency (ARPA). There have been several name changes in the interim for the military side of the Internet, to include Milnet and now the Defense Digital Network (DDN). DDN forms the backbone for much of the Internet used by Americans. The initial studies and funding for things like packet switched networks and TCP/IP were done by the military as a part of developing the electronic battlefield. TCP/IP was also a Military Standard (MIL-STD) until it became a Federal Information Processing Standard (FIPS).

In 1983 there was actually an Atari 8-bit user group that meet biweekly in the Pentagon. (I was a member.) Over half of my the Atari Club in Colorado Springs (P3ACE) was military. I was also a member of the Naval Postgraduate School Atari Club which met on base. There is even a club at Fort Leavenworth (the Army side, not the Federal Prison side <grin>) There have been and still are Atari Clubs at many, many military installations. Military members have been very avid supporters of Atari computers.

If Clay Halliwell looks around and his job can justify it, he might be able to get a DDN account. Most military base e-mail accounts include DDN (Internet) access these days--and you can even dial in from home. This is all part of the military's plan to make its members more computer literate.

Another point of reference, the Coast Guard is not part of the Department of Defense, it is part of the Department of the Transportation. It only becomes "military" during wartime when it is put under the DoD. Coasties can also be sworn peace officers (police), unlike the military in this country.

4913. XF551 software

Newsgroup: comp.sys.atari.8bit
Date: 1994-08-26 22:45:37 UTC
From: didi@didi.mayn.sub.de
Message-ID: <didi.00mw@didi.mayn.sub.de>
Source record: 98800

Hello,
somebody asked for a DOS for the XF551, the new BW-DOS is supporting this drive
and also the higher speed. I hope the DOS is soon on the server.
I know the XF Tooldisk, a disk full with special software only for the XF.
It is shareware in germany, and if somebody is interested I can sent by
uue-mail.
Gruss

Sure, that would be $0600 or 1536. :)

Just couldn't resist but I probably should have.

Regarding running M.U.L.E. on a PC...

I believe that their was a PC version at one time (I would suspect it is not too good though... probably CGA, and poor response as many of the PC games of that period were....)

It might work under XF2, but you could probably only play against the computer..... (plus no sound), as long as it doesn't require player missle collision detection (and you find a deprotected copy... I own an original, and deprotected it... even preserving the fancy M.U.L.E. loading screen - don't go calling me a cracker either... I only cracked 3 or 4 things....).

When XF3 comes out, if it has a way of interfacing Atari joysticks to it (or using IBM analog ones... blech) it should work (as long as you have a deprotected version, or aquire one...)

4917. Atari emulator ideas for PC

Newsgroup: comp.sys.atari.8bit
Date: 1994-08-27 00:02:21 UTC
From: curtis@darkwing.East.Sun.COM
Message-ID: <33lvqd$jr6@walters.East.Sun.COM>
Source record: 98845

This is directed at Atari emulators for PCs....

regarding joystick emulation, etc....

paddle emulation could be done via the PC game port(s). It might
even be possible to build an adapter cable to use Atari paddles on
these ports.

Atari joystick use/emulation could be done in a few ways (or
a combination to provide up to 4 joysticks (when emulating a
400/800)) !

1. should be albe to do hook Atari joysticks to PC printer ports...
as I recall their are 5 lines usable for getting signal imputs..
perfect ! 4 for direction, 1 for trigger
since the PC's support up to 4 parallel ports... 4 joysticks
(but most people only have 1 parallel port, so this is good for
joystick 1)

2. Emulation through PC joysticks..... and possibly even hookups of
resistor networks and Atari joysticks to these ports... good for
2 joysticks.

3. keyboard could be kept as well....

I personally like option #1 at least for joystick 1....

Atari emulator writers are you listening ? :-)

Just some ideas....

Oh, and I do own Ataris.... I'm not just an emulator owner...

[Stuff about XF deleted]

Okay..can someone explain why the heck my 3.5 inch XF551 mod drive
(eprom upgrade that was published... wooleys I think) always always
flakes out when hooked via the way atari wanted it... but whenever
I mount the stuff off a Switching power supply... 5 volts running into
the floppy power connector and power to the drive itself it works almost %100
flawlessly?!?!?

I have NEVER EVER had a working XF551 drive without gutting it
and hooking it up to 3.5's and seperate power supplies. I never could
ever get the 5.25 mech to work with the board.

And Ive tried 3 XF's!

I've never had problems with my 551, but if the switching power supply works for you, great. Do you just plug it in in place of the 9V AC supply, or wire it to the circuit board?

[Article crossposted from comp.sys.amiga.programmer]
[Author was Matt Schmill]
[Posted on 26 Aug 1994 21:34:47 GMT]

As is customary, the [one of the] Amiga MULE project[s] is losing its momentum.
I am therefore calling upon ambitious C coders to join the cause and work toward the ultimate goal of a vamped up MULE for the 90's.

The premise is the same, and we hope to leave the original appeal intact while adding flavor and variety to the mix. We have a good portion of code and design in place and a lacking mainly in the area of inertia. That's why we need YOU to make so many people's wishes come true. We have a mailing list and an FTP site, and a sharp set of graphics shaping up.

So come on, already, don't you want to see your name in lights in several, if not DOZENS of peoples homes scrolling across the screen of this decade's hottest amiga game to hit the streets ?

Of course you do...

: DT>problems hooking up mine. Receive a "Mode Select Command Failed" and a
: DT>"Request Sense Command Failed"

: Make sure parity checking is disabled. Check your manual and jumpers to
: find out how to do this.

Parity comes already disabled on this drive. And was able to get another
3.5 to format but on sector verification it would flag a number
of bad errors and an error 029. The 3.5 has a SCSI II embedded controller.
It acts like it is timing out after beginning the verification process.

By the way, there is no problem at all using the Black Box with an 88 Meg
removable and it has an embedded SCSI II also. Do not know if there are
any real differences between the two SCSI controllers.

But something is different!

4926. [--- DIVER.BAS ---]

Newsgroup: comp.sys.atari.8bit
Date: 1994-08-27 07:23:35 UTC
From: winston@merk.com
Message-ID: <Cv6n7C.HGt@merk.com>
Source record: 98854

Bill K.,

I haven't tried your soundplayer yet, but thinking about it got me to wondering. There is a famous, small ATARI BASIC program called DIVER.BAS that is very cute. You dive for treasure chests and, as you go down, you leave a stream of bubbles overhead (sort of like R.O.T.O.). Since the program is so tiny, would it be possible to add digital sound effects to it such as sonar pings, air bubbles, and creaking lids? Would there be enough space left in machine RAM for some tiny samples and a player? I always thought that it was a shame that DIVER.BAS never included some realistic sounds since it was such a visually pretty game.

I really miss my 8-bit, and since nobody's working on a Macintosh emulator, I'll have to bring the old thing here to the DC area. Catch is, I'd like to bring it down via airplane, and I don't know how the damned X-Ray machines treat 8-bit equipment.

I'll be bringing back:

130XE
1050 disk drive
Several game cartridges and assorted floppies.
Cables and power supplies.

Will ANY of the above be adversely affected by being run through an airport X-ray machine? It's older equipment, so this is why I'm asking.

Please E-MAIL responses before Sunday night, US time.

Thanks for your help, folks! I'd like to play Star Raiders and do some 6502 programming with MAC/65 again!

Famous!? I haven't seen it!!! :)

And yeah, digital sound'd probably fit if it's small. The player code is INCREDIBLY small (like .5k at the most??) As to where you'd GET the sounds, that's another question.. Internet's good, but also some files are a bit bigger than you'd like (what if you had a sonar ping that was like 5-10k!?) because of the sampling rate used.. Kill bytes in the file I guess....?

Also, remember that digital sound freezes up the system (usually, unless you code stuff in hard-assembly like euro-demo'ers do!)... Also, you'd have to find a place to store a 0 otherwise it'll store it at location 559 and that'll blank your screen when the sound plays! :)

I think most people out here who've played with digital sound a little "know what we're doing" but Dean Garraghty's name pops up :) and so does Tony Ramos (inventor of Parrot, am I right?)

later!

Welp, I've done it.. I've killed my MYDOS.ATR file for SIO2PC.. No, this wasn't just some simple little DOS.SYS + DUP.SYS on a 20k disk image.. this was EVERYTHING.. all of my good utils (TBAS, ARC, UNARC, JVIEW, and on and on and on and on and ON!)

GONE! 360k (well, not FULL, thank god, but maybe 3/4th full) of data WIPED!

NO BACKUP! (Either that or it's not ZIPped.. I searched through ALL OF MY 3.5" DISKS AND MY HARD DRIVE (that I checked twice) FOR *.ZIP)

Sooooooo

HOW CAN ONE RECOVER A PARTIALLY-FORMATTED MYDOS DISK!?

I looked within the image file and the data's there, nothing got 0'd out except the directory I guess, so I think what would help is
1) VTOC fixing it (because it now thinks its only a 92k disk)
2) UNDELETING *.*

BUT THERE'S NO MYDOS UNDELETE!!! (or at least >I< dont have it!)

SOMEBODY HELP ME!!!

It's either this (hope hope hope) or try to look at the root directory (if it EXISTS anymore! :(:(:( ) and try to find all of my spare/original copies of what I had on my master disk!

Thanks in advance!!!!! :(:(:(

From: Rick_Michael_Cortese@cup.portal.com
Message-ID: <121065@cup.portal.com>
Source record: 98760

It's been my experience that disk drives use about 1.2 amps from the
12v power supply. I'm not sure which 7812[T,C,..?] Atari used in
the design, but I'd bet dimes to dollars it's the bare minimum considering
the heat sink they used. I traced my problems to certain disks, If the
jacket caused the disk to drag a little extra it was enough to
overload the power supply & error out. I never bothered fixing it, just
gave up & use an ATR.

4935. MASSIVE AUCTION II -- lots of Atari stuff! (update #2)

In a previous article, kendrick@zippy.sonoma.edu (William Kendrick) says:

>Welp, I've done it.. I've killed my MYDOS.ATR file for SIO2PC.. No, this
>wasn't just some simple little DOS.SYS + DUP.SYS on a 20k disk image.. this
>was EVERYTHING.. all of my good utils (TBAS, ARC, UNARC, JVIEW, and on and
>on and on and on and ON!)
>
>

MS DOS 5 has an Undelete program and I've used it on MS DOS 3.2. I don't
know if it will work on a transformed disk (Atari to IBM or IBM to Atari.)
I can't guarantee the results & I advise that you make a copy of your bad
disk before trying to undelete.
But first:
I had trouble with my used IBM computer when I bought it. It wouldn't
read some disks. Someone told me to clean the floppy drive heads with tape
head cleaner and a cotton swab.
It worked. Now I use a cleaning disk once a month, use my computer daily
& haven't had any problems in months.
I advise cleaning the heads with cleaner and cotton swabs every few months
eventhough the cleaning disk seems to work. There was alot of brown/black
stuff on the heads when I cleaned them with the cotton swab as if friction
between the head and the floppy diskette removed some of the diskette and
deposited it on the heads.
Also, never leave the door closed on your floppy overnight. An Atari 810
drive leaves an indentation on my floppy disks which may or may not cause
troubles.

>>I think I have the RAM speeds figured out. The 6502/65816 take only 1
>>cycle to access memory, whereas the 680x0 series designs take 4 cycles.
>>Thus at a given clock speed, memory can be accessed much more frequently
>>in the 6502/65816. 35ns for 12.5 MHz 65816 actually works out to 4 times
>>faster than 70ns for 25MHz 68030, so it checks out. Although, it is
>
>I don't think this is correct either. The fastest instruction on a 6502
>is 2 cycles, and the slower ones can be up to 7. RAM is definitely not
>used every cycle. Are you saying the fetch is only a cycle? I do not know
>if 680x0's use more than a cycle for the actual fetch.

Yes, I meant the actual memory fetch is only one cycle. It is 4 cycles on
the 68000, again, just the memory fetch portion. (8 cycles for a load from
memory to a register).

So even though it is not used every cycle, it is used proportionally faster
on a 6502 than it is on a 68000.

No! Hehe.. I said MYDOS! Ok, here's what I had:

SIO2PC had the following drives up:

MYDOS.ATR/p (physical access, it works with the file on the hard drive,
rather than load it and play with it in RAM and save it..)
something.ATR (I dont remember what it was, but I was going to format it)

Anyways, the MYDOS disk image was D1: and the other was D2:.. I accidentally
told MyDOS to find out what type of drive D1: was (rather than set it up manu-
ally as a SD 360k drive) so it said to itself "ok, now D1: is SD 88k"

Then I told it to format it.. I dunno WHAT I was doing, probably typing too
fast and not paying attention. I sorta wish MyDOS's format was a bit more
pissy.. perhaps randomly picking a letter to type if you're sure, so that you
HAVE to pay attention!!! :) ("press '\' to format >> DRIVE 1 << !!!!!!!")

THEN, I went to do whatever I was doing (copying?) to D2: and it said out of
disk space! "WHAT!?" Uh oh, 0000 free sectors! SHHHH...ucks... I killed
it.. I >USED< to have a ZIPped copy of my MYDOS.ATR somewhere but I probably
erased it thinking "nah, I wont be THAT stupid"

I guess I win the "yup, you ARE "THAT stupid"" award this year..

<sigh>

I guess I could try to remember what was on it, but I'd rather just be able
to recover it!

And re: MSDOS undelete.. yeah, I know of that and use it hehehehehehh :)

thanx though!

To paraphrase:
: I [deleted] it.

Well...I don't know much about atr files... but if you can get the
data to a real atari mydos disk... with some sector util or something
... then you can use one of the many Double Density disk fixers to
allocate file names for all the lost links. =)

I dont think putting it on a real floppy would make any difference.. Atari's
treat SIO2PC ATR images as if they were real disk drives on the SIO port.
A sector copier works from ATR to real disk or ATR to ATR or, as we all know,
real disk to real disk.

I think I may just say "screw it," try to look for at least SOME of the files
(I always had 0 REM SAVE"D:<filename.ext>":RUN at the beginning of all of
MY Atari BASIC / TurboBASIC XL programs for quick saving (LIST 0, upupup,
ctrl-delete 6 times, return :)) so I can find those.. also, I'll probably
notice titles and/or menus of programs within the sector data) and then try
to remake my collection by looking on my 12s of disks :)

<sigh>

Go get SWEETA.DCM and SWEETB.DCM if you have an XL and the ability to make DD disks!

The first intro to SWEETA is NICE... it reminds me of well-made NES games or even Amiga games... That type of intro would be GOOD for a complex space game...

4948. IDE hard drive on 8-bit Atari

Newsgroup: comp.sys.atari.8bit
Date: 1994-08-28 06:12:40 UTC
From: shendrix@escape.widomaker.com
Message-ID: <1994Aug28.061240.898@escape.widomaker.com>
Source record: 98780

I have finally finished college and I'm starting to put some of my old
computers back together. I ran UNIX for the last 3 years and that
system is still my main system. However, I am working on getting an
Atari ST working again. I also have lot's of old Atari 8-bit stuff.

What I would like to know is the following:

* best overall interface system (for hard drives mostly)
* do any of the available interfaces allow the use of IDE hard drives?

I have an Atari 850 interface but nothing else (besides disk drives
and a 256K Atari 800XL).

: Pretty cool! Hey, will JView handle that res? What about At8Gif (the only
: other 320x200x2 GIF viewer for Ataris that I know of)??

I can go grab it and scale it down for you if you want. What size would
you prefer, 320x200? Being only 2 colors, it'd look quite cool in GR.8
mode.

-Joe

4951. For sale (need cash for project)

Newsgroup: comp.sys.atari.8bit
Date: 1994-08-28 19:07:53 UTC
From: kamaro_kid@delphi.com
Message-ID: <Rk9SOcB.kamaro_kid@delphi.com>
Source record: 98779

3 slave CSS multiplexor with about 60' of 34pin ribbon cable.

This unit is complete with 3 roms, manual, ribbon cable, 3 slave carts
and one master cart.

Everything needed to setup your very own Atari network. Will work on
virtually every computer (800xl, 130xe, 600xl, 1200xl, etc.)

Asking $225.00 or best offer.

3 slave MUX brand new with THAT much ribbon cable would cost
somewhere around $350.00 (roughly)

4956. Can I use Sio2pc on 286-PC??

Newsgroup: comp.sys.atari.8bit
Date: 1994-08-29 04:15:46 UTC
From: odaman@rocky.unoke.pfu.fujitsu.co.jp
Message-ID: <9408290410.AA01902@rocky.unoke.pfu.fujitsu.co.jp>
Source record: 98785

Hi, all.

I think most people who read c.s.a.8 are using Sio2pc with FUN, I have one question.

I am thinking of PC. I might will buy 286-PC for use Sio2pc. CAN I USE SIO2PC WITH 286-PC??

A only one my fear is lack of speed. Most users uses 486-PC, I think, and Sio2pc must runs well on 486-PC. But when on 286-PC, I am doubting this 286-PC's speed.

I still don't get Atari130xe.... I sent money already... :-(

Thanks!! Please answer me!!

>Huh... Sorry I was so dense. :) Well, I wonder what makes it so fast, maybe
>the fewer addressing modes?

I think it's just good design. :-) And the 65816 adds more addressing
modes without loosing the one cycle access. Intel chips have lousy
addressing modes, and slow memory access.

Any hardware experts care to enlighten us as to how the 6502 performs
memory fetches in one cycle, while other chips are slower?

>do you have?

There are more changes required besides the ANTIC chip. The crystal, and
several other parts. I think the oscillator section is replaced. I
haven't actually done a PAL mod, but my partner did have to do some, and so
even though the info is sketchy, it is a fairly involved mod.

Source record: 98787

OdaMan! Hi! SIO2PC works well with my 8086! It's using a PRE-286 CPU!
BUT.. for some reason I have had trouble running SIO2PC with 386 and 486
CPUs! THat's crazy! (Does anyone know why this is?)

As long as the 286 you get can talk to the COM ports (RS232 I/O ports) at
19.2k bps or higher, you're ok..

Good luck! Did that guy who's supposed to send you the 130XE ever tell you
how he mailed it!?

Later!

In article <1994Aug28.061240.898@escape.widomaker.com>,
shendrix@escape.widomaker.com (Shannon Hendrix) writes:

>What I would like to know is the following:

>* best overall interface system (for hard drives mostly)
>* do any of the available interfaces allow the use of IDE hard drives?

To my knowledge, there is no way to use an IDE drive on an 8-bit or an ST.
The only ST that has an IDE drive really isn't an ST. It's that thing
they called the Falcon030.

The best drive to use on the 8-bit is a SCSI drive. I just bought a used
Quantum 50 megger for $50, which I'm going to plug into an ICD MIO when it
arrives in a week or so. If you look around, you can score a 256K MIO for
around $80.

Rob

4962. MASSIVE AUCTION II - update #3 (includes lots of Atari)

Newsgroup: comp.sys.atari.8bit
Date: 1994-08-29 08:20:23 UTC

I've heard of all these great files and demos, Intel OUTSIDE gif, European demos, etc. - yet I havent seen them uploaded anywhere.

I've logged onto WUARCHIVE multiple times, but the files are never there.

Now that UMICH is near impossible to logon to, should we go to another site for new uploads?

|> The drive does work fine if I keep a little fan cooling off the heatsink.
|> Does anyone have any suggestions for me? Is there a way to test transistors?

A problem I have seen with other Atari drives involves the filter
capacitor in the power supply circuit. This should be the largest
round tin-can-like component with a plastic wrapper. When one of
these shorts out, the voltage regulator is stuck with trying to
dissipate the current coming out of the transformer and being shorted
to ground. Try replacing the filter cap with an equivalent (or larger
as far as capacitance or voltage rating) device, and see if that allows
everything else to run cooler.

In a previous article, kamaro_kid@delphi.com says:

>Now that UMICH is near impossible to logon to, should we go to another
>site for new uploads?

It's easy to logon to. Does Delphi offer Gopher? I think it does. Point your Gopher client to gopher.archive.merit.edu and choose Merit Software Archives. Fast and easy.

Although, you can't upload with Gopher. But as Jody Lenn pointed out, you can FTP to msdos.archive.umich.edu or amiga.archive.umich.edu and just maneuver to the Atari directories just fine. They may not appreciate people doing that, but it works for now.

Finally, you can always upload to Merit/UMich by mailing uuencoded files to lenn@atari.archive.umich.edu.

I don't want to try & pass myself off as knowing what I'm talking about, but I've got the impression the 6502 could be defined as the first generation RISC processor. Matter of fact, I've heard T400 & T800 series are derivative of the 6502. I started out with an 1802 based system & remember some of the discussion that was going on at the time before the terms 'complex instruction vs reduced instruction' were in vogue. What I heard is the silicon in a 6502 only allows for a maximum of 256 instructions where some of the other processors can have literally thousands of instructions. The micro code in a 6502 needs fewer tics to decode the limited instructions. Comparing the 6502 to an 1802 or any of the other processors i.e. 80xx, Z80, the CISC have the ability to do two instructions at once. A classic example is auto incrementing an index register. So what we do with a STA $4000,X: INX sequence they can do with a 'Store via X & increment' instruction. The down side of that scheme is even when you just want to do something simple like an INX or PHA you still have all the overhead of the micro code's instruction decoding & enough tics on the clock to execute what could be a two stepper for us going on. On the plus side fo CISC is you can write really small code. I've never really tried to do a comparison myself . but I'd guess a
Z80 or 8088 could do the same thing a 6502 could in maybe 25% less code. Hard to believe when you see the bloated MS DOS programs, but those things probably won out over the 6502 in a lot of applications just because you could use a single/smaller ROM.

: Any hardware experts care to enlighten us as to how the 6502 performs
: memory fetches in one cycle, while other chips are slower?

The 6502 is actually pipelined- it loads from memory into a buffer and then
waits for the previous instruction to finish. Kind of like a Pentium.
:)

I was intrigued to learn that the 1802 is the CPU in the Voyager probes
:) Anyway, there is still a thread going on (I think) in the
amiga.advocacy group about CISC vs. RISC in which the main focus centers
on whether the 6502 qualifies. Many people have said such of the 6502,
including Tom Hunt not so long ago. Many programmers seem to recognize
this facet of the 6502 in comparison to the Z80 at least... It does seem
to be much easier to learn ML on a 6502 type archetecture where you are
only dealing with a few registers than the 6809 or Z80 with far more
registers and addressing modes. You probably start thinking in terms of
building subroutines from the "primitives" instead of learning tons of
register manipulations to do things in other CPUs. It seems to me you
can get lost dealing with a zillion CPU registers and potentially screw
something up very easily, whereas with the 6502 it's all "external" and
easier to conceptualize.

4974. Looking for an sio2pc remote programs for spartados

Newsgroup: comp.sys.atari.8bit
Date: 1994-08-30 03:55:42 UTC
From: kevina@clark.net
Message-ID: <33uaju$de@explorer.clark.net>
Source record: 98798

Hello there,

I was wondering if anyone has created a quick an dirty utility
that will allow you to send a command string to Sio2pc via the SpartsDOS
command line.

If not I was wondering if someone would be willing to write one
for me and all the other Sio2pc users with SpartaDOS.

It would be rather simple to do all you have to do is send a 128
byte sector to D9: or ID #39h with the instrution string given in the
command line and then wait to see if there is a sector in responce (For the
'R") command.

If someone would be intersted in writing one but does not have
the tecnical deatail I would be glad to assest you in that area. I would
write it myself except the only Atari language I know is Atari BASIC.

Any help would be appreshated.

<stuff deleted>

Well, this is somewhat correct. The 6502 only uses a byte for opcode. The
individual bits all mean something and the combinations of them make up
the logical instructions. This means the instructions are not "interpreted"
but rather trigger direct microcode sequences. This is similar to RISC
except that the operations require a cycle each rather than a single cycle
as per RISC CPUs. The instr. set and layout of the 6502 is simpler than
most CPUs of the day (look at the setup of a Z80!) and this made it
effecient and easy to learn. Its best traits IMHO.

It's funny, but you hit the nail on the head with the zillion register comment! The 1802 had 16 x 16 bit general purpose registers that could be used as the program counter or anything else for that matter. What happened <foggy memory> was people would use them as pointers or program counters to their mods & canned subroutines. So let's say someone adds a video chip, he just takes over PC #0, let's say someone else added a color video board, he takes over PC #1. Since the thing comes up with PC #0 as the official PC & most people only had maybe one subroutine in their code, blammo! you'd have to rewrite everything. It was chaos. All that was needed was a little organization, but it never happened. Having to go in & patch your code with only a cassette hex key board & 32 byte ROM was a hassle. When I mentioned the 1802 on the probe Wooley jumped in & said he had one too. Small world.

I have always thought of page zero on 6502 systems as being 256
pseudo-registers, since they can be used for indirection access modes.
I don't know how the experts qualify what makes a true register, but
viewed this way the 6502 is a well-adorned CPU.

Finding this thread made me remember when, knowing only 6502
assembler, I sat down to read about the VAX architecture. Wow, was I
ever bowled over. In my naive state of mind, I kept looking through
the manuals, searching for the _real_ instruction set -- surely, I
thought to myself, all of these instructions are somehow interpreted
by the assembler as macros...

FIFTH UPDATE!

I will be posting these updates every 24 hours. I will also try to send
E-mail to all bidders, if time allows. Please check the newsgroup on which
you read the auction message.

Also, I have used the first part of your E-mail address when listing bids.

****

Games and/or game systems included in this auction include:

ATARI 2600 ATARI 5200 ATARI 7800 ATARI 8-bit
ATARI LYNX COLECOVISION INTELLIVISION ODYSSEY2
SEGA MASTER SYSTEM TEXAS INSTRUMENTS TIMEX SINCLAIR

AUCTION RULES:
1) THE DEADLINE FOR BIDDING IS 11:59 P.M. EST, ON FRIDAY, SEPTEMBER 2ND.

2) MINIMUM BIDS ARE LISTED FOR EACH ITEM UP FOR AUCTION, MINIMUM INCREMENTS
ARE $0.50 ON GAMES AND $1.00 ON SYSTEMS.

3) NO PACKAGE DEALS ON GAMES OR SYSTEMS.

4) TRADE OFFERS WILL BE ENTERTAINED, BUT CASH OFFERS ARE GIVEN PRIORITY.

5) EVERYTHING IS SOLD AS IS. UNLESS SPECIFIED, ALL GAMES AND SYSTEMS HAVE
BEEN TESTED AND ARE IN WORKING ORDER.

6) BUYER PAYS ALL SHIPPING COSTS.

7) IN CASE OF TIES, FIRST BID RECEIVED WINS.

8) PLEASE DON'T MAKE A BID UNLESS YOU ARE PREPARED TO BUY AN ITEM.

9) PAYMENT MUST BE MADE IN U.S. FUNDS.

NOTE: ALL CARTRIDGES ARE LOOSE (IE. WITHOUT BOX AND MANUAL), UNLESS SPECIFIED.

HARDWARE:

LOT #1

ATARI 2600 SYSTEM (6 SWITCH DESIGN), WITH TWO (2) ATARI JOYSTICKS, POWER SUPPLY, RF SWITCHBOX, AND SEVEN (7) GAMES [NO BOXES, OR MANUALS FOR GAMES]:

ASTEROIDS (Atari)
BERZERK (Atari)
COMBAT (Atari)
DEFENDER (Atari)
MISSILE COMMAND (Atari)
PAC-MAN (Atari)
SPACE INVADERS (Atari)

MINIMUM OPENING BID OF $23.00

*****

LOT #2

ATARI 2600 SYSTEM (6 SWITCH DESIGN), WITH TWO (2) ATARI JOYSTICKS, POWER SUPPLY, RF SWITCHBOX, AND SEVEN (7) GAMES [NO BOXES, OR MANUALS FOR GAMES]:

ASTEROIDS (Atari)
BERZERK (Atari)
COMBAT (Atari)
DEFENDER (Atari)
MISSILE COMMAND (Atari)
PAC-MAN (Atari)
SPACE INVADERS (Atari)

MINIMUM OPENING BID OF $23.00

*****

LOT #3

ATARI 2600 SYSTEM (6 SWITCH DESIGN), WITH TWO (2) ATARI JOYSTICKS, POWER SUPPLY, RF SWITCHBOX, AND SEVEN (7) GAMES [NO BOXES, OR MANUALS FOR GAMES]:

ASTEROIDS (Atari)
BERZERK (Atari)
COMBAT (Atari)
DEFENDER (Atari)
MISSILE COMMAND (Atari)
PAC-MAN (Atari)
SPACE INVADERS (Atari)

MINIMUM OPENING BID OF $23.00

*****

LOT #4

ATARI 5200 (W/2 JOYSTICK PORTS), ONE ATARI CONTROLLER, ATARI POWER SUPPLY, RF SWITCHBOX, AND TWO (2) GAMES [NO BOXES FOR GAMES]:

PAC-MAN (WITH MANUAL)
POLE POSITION (WITH MANUAL)

THE CONTROLLER IS WORKING, BUT THE CONTACTS ON THE INSIDE NEED CLEANING
PERIODICALLY. I WILL ALSO THROW IN A NON-WORKING CONTROLLER FOR PARTS, FREE.

$35 ac446

*****

LOT #5

ATARI 5200 (W/4 JOYSTICK PORTS), ONE ATARI CONTROLLER, ATARI POWER SUPPLY,
ATARI RF/POWER SWITCHBOX, AND TWO (2) GAMES [NO BOXES FOR GAMES]:

$ 3.00 PAC-MAN
$ 4.00 POLE POSITION (WITH MANUAL)

THE CONTROLLER IS WORKING, BUT THE CONTACTS ON THE INSIDE NEED CLEANING
PERIODICALLY. I WILL ALSO THROW IN A NON-WORKING CONTROLLER FOR PARTS, FREE.

$32.00 GEOFFOLTMAN

*****

LOT #6

ATARI 7800 WITH POWER SUPPLY, RF SWITCHBOX, AND ONE (1) GAME:

POLE POSITION II (7800)

I DON'T HAVE ANY WORKING 7800 CONTROLLERS, BUT I WILL INCLUDE INSTRUCTIONS
ON HOW TO MODIFY A SEGA GENESIS CONTROLLER TO WORK ON THE ATARI 7800. I HAVE
ALSO HEARD THAT SEGA MASTER SYSTEM CONTROLLERS CAN BE MODIFIED.

NOTE: REMEMBER THIS SYSTEM ALSO PLAYS ATARI 2600 GAMES.

$18 U37690

*****

LOT #7

ATARI 400 COMPUTER WITH ONE ATARI JOYSTICK, RF SWITCHBOX, AND PAC-MAN CARTRIDGE.

THIS SYSTEM DOES NOT COME WITH A POWER SUPPLY. THE SPECIFICATIONS FOR THE
POWER SUPPLY ARE AS FOLLOWS:

MODEL NO. -- CO 14319 (Atari)
INPUT: 120 VAC, 60 HZ, 18.5 W
OUTPUT: 9 VAC, 15.3 VA

MINIMUM OPENING BID OF $16.00

*****

LOT #8

ATARI 400 COMPUTER WITH ONE ATARI JOYSTICK, RF SWITCHBOX, AND PAC-MAN CARTRIDGE.

THIS SYSTEM DOES NOT COME WITH A POWER SUPPLY. THE SPECIFICATIONS FOR THE POWER SUPPLY ARE AS FOLLOWS:

MODEL NO. -- CO 14319 (Atari)
INPUT: 120 VAC, 60 HZ, 18.5 W
OUTPUT: 9 VAC, 15.3 VA

MINIMUM OPENING BID OF $16.00

*****

LOT #9

COLECOVISION SYSTEM WITH SYSTEM MANUAL, COLECO POWER SUPPLY, COLECO RF SWITCHBOX, TWO (2) CONTROLLERS, AND DONKEY KONG CARTRIDGE (W/MANUAL).

MINIMUM OPENING BID OF $28.00

*****

LOT #10

COLECOVISION EXPANSION MODULE NO. 1: ATARI 2600 CONVERTER (Coleco). PLAY VIRTUALLY ALL ATARI 2600 GAMES ON YOUR COLECOVISION SYSTEM.

MINIMUM OPENING BID OF $20.00

*****

LOT #11

INTELLIVISION SYSTEM WITH TWO (2) BUILT IN CONTROLLERS, POWER CORD, AND RF SWITCHBOX. SYSTEM ALSO COMES WITH SEVEN (7) GAMES [NO BOXES, MANUALS, OR OVERLAYS FOR GAMES]:

ADVANCED DUNGEONS & DRAGONS
BURGERTIME
NFL FOOTBALL
POKER (SAME AS: LAS VEGAS POKER AND BLACKJACK)
SPACE ARMADA
SPACE BATTLE
SPACE HAWK

$37.00 jlodoen

*****

LOT #12

ODYSSEY2 SYSTEM WITH ORIGINAL RF SWITCHBOX, POWER SUPPLY, AND TWO (2) CARTRIDGES [NO BOXES OR MANUALS FOR GAMES]:

AJ 9400 - SPEEDWAY! / SPIN-OUT! / CRYPTO-LOGIC!
AJ 9402 - FOOTBALL!

BOTH CONTROLLERS ARE MISSING THE LITTLE BLACK KNOB OFF THE TOP OF THE JOYSTICK, OTHERWISE EVERYTHING WORKS.

MINIMUM OPENING BID OF $25.00

*****

LOT #13

TEXAS INSTRUMENTS -- TI 99/4A COMPUTER WITH ORIGINAL POWER SUPPLY, ORIGINAL RF SWITCHBOX, AND FUNCTION KEY STRIP (FOR KEYBOARD).

$15 tom

*****

LOT #14

TIMEX SINCLAIR 1000 COMPUTER, WITH 16K EXPANSION ATTACHMENT (T.S. 1016). REQUIRES A 9V POWER SUPPLY, WHICH IS NOT INCLUDED.

THIS COMPUTER APPEARS TO WORK, BUT BIDDERS SHOULD CONSIDER THE WORST CASE SCENARIO WOULD BE GETTING THE 16K EXPANSION AND A Z80A CPU.

$10 galt

4981. sio2pc problem

Newsgroup: comp.sys.atari.8bit
Date: 1994-08-30 23:07:45 UTC
From: bruck@brachot.jct.ac.il
Message-ID: <9408302306.AA11013@brachot.jct.ac.il>
Source record: 98655

I have an SIO2PC, and I use it with my 800 and 1200xl, alongside an 8088 PC-XT.

Once in a while, in the middle of loading something, it just pauses for 5 seconds or so, then continues as if nothing had happened.
This happens in the middle of getting a directory, during booting, while loading software, etc. It's the same on both my Ataris (I have no way to test this on other PCs).

The delays don't cause any errors or anything.. They just piss me off.

Anyone got any ideas? This thing cost me $50!!!!!!!

9.2) What is an .arc file?
9.3) Okay, how about a .dcm file?

Emulation
10.1) What 8-bit Atari emulators exist for other computing platforms?

File Transfer Solutions
11.1) What are the best telecommunications programs available?
11.2) Can I read/write 8-bit Atari disks on an IBM-PC?
11.3) Can I read/write DOS disks on an 8-bit Atari?
11.4) How do I transfer files using a null modem cable?

Storage Media
12.1) What 5.25" floppy disk drives are available?
12.2) How can I use 3.5" floppy disks with my 8-bit Atari?
12.3) What do I need to connect a hard drive to my 8-bit Atari?
12.4) How can I use an IBM-PC as a storage device for my Atari?

General Interest
13.1) What's the best DOS for the Atari?
13.2) What hardware has Atari created in the 8-bit computer line?
13.3) What are the pinouts for the...?
[to add: M.U.L.E./Mule, power supply requirements]

Other Documents of Interest
14.1) What product developers or vendors support the 8-bit Atari?

14.2) Where is my nearest 8-bit Atari BBS?
14.3) Where is my nearest 8-bit Atari user group?
14.4) How do I use my new or emulated Atari?

==========
1.1) What is this 8-bit Atari FAQ List?

The Atari 8-Bit Computers Frequently Asked Questions List was created to provide answers to many commonly asked questions found in news:comp.sys.atari.8bit, the Info-Atari8 Digest, and INFO-A8. It is in a constant state of development.

Much of this FAQ List is geared toward providing information on the various Internet resources available for 8-bit Atari users.

Where to get the latest copy of the 8-bit Atari FAQ List:

ftp://rtfm.mit.edu/pub/usenet-by-group/news.answers/atari-8-bit/faq
(and many other FTP sites that archive Usenet FAQ Lists)
http://www.cis.ohio-state.edu/hypertext/faq/usenet/atari-8-bit/faq/faq.html
news:comp.sys.atari.8bit, news:comp.answers, news:news.answers

or, send a message to mailto:mail-server@rtfm.mit.edu that says:

send usenet/news.answers/atari-8-bit/faq
quit

Finally, you can always ask me for a copy at mailto:mcurrent@carleton.edu

This FAQ List is automatically posted to news:comp.sys.atari.8bit, the Info-Atari8 Digest, INFO-A8, news:comp.answers, and news:news.answers, every 30 days.

==========
1.2) What is an Atari 8-bit computer?

Under construction

==========
2.1) What is comp.sys.atari.8bit?

news:comp.sys.atari.8bit is the unmoderated Usenet newsgroup for discussion about the 8-bit Atari 400/800/XL/XE computing platform. All postings to news:comp.sys.atari.8bit automatically appear in the Internet's Info-Atari8 Digest and in BITNET's INFO-A8.

[I'd like to include the charter for news:comp.sys.atari.8bit here. Anyone know where to get it?]

==========
2.2) What is comp.sys.atari.announce?

news:comp.sys.atari.announce is the moderated Usenet newsgroup for news items and announcements related to all Atari computing platforms. This is a low-volume, high-signal newsgroup, useful for reaching the widest

possible audience when making 8-bit Atari announcements.

==========
2.3) What is comp.sys.atari.advocacy?

news:comp.sys.atari.advocacy is the unmoderated Usenet newsgroup for advocating the usefulness, or uselessness, of all Atari computing platforms. If you're into flaming about Atari 8-bit computers, this is the place for you.

==========
2.4) What is comp.emulators.misc?

news:comp.emulators.misc is the unmoderated Usenet newsgroup for the discussion of emulating computing platforms on other computing platforms. All emulator discussion that does not involve the Apple][, the Commodore 64, or the WINE MS-Windows emulator (which each have their own emulator groups) may be found on news:comp.emulators.misc.

==========
2.5) What is comp.emulators.announce?

news:comp.emulators.announce is the moderated Usenet newsgroup for news items about emulating one computing platform on another. This is a low-volume, high-signal newsgroup, useful for reaching the widest possible audience when making 8-bit Atari emulator announcements.

The moderator may be contacted at mailto:emulators-request@qualcomm.com

==========
3.1) What is the Info-Atari8 Digest?

If you do not have Usenet access, but you do have Internet e-mail access, you can access this discussion group through the Info-Atari8 Digest.

The Info-Atari8 Digest originates from

mailto:info-atari8-request@pine.cse.nau.edu

Subscription requests should be sent to the above address with the subject:

SUBSCRIBE | UNSUBSCRIBE (that is, one or the other)

The first line of the body of the letter should be the person's full name followed by his/her mailing address. For example:

Mike Todd snyder10@convex1.tcs.tulane.edu

To contribute to discussion threads in the Info-Atari8 Digest, send your posting to mailto:comp-sys-atari-8bit@cs.utexas.edu. Postings sent here automatically appear on news:comp.sys.atari.8bit and in BITNET's INFO-A8.

Note that any posting sent to mailto:info-atari8@pine.cse.nau.edu will NOT be cross-posted to the Usenet side. The Moderator is presently working to correct this.

The Info-Atari8 Digest Moderator is:
Mike Todd, mailto:snyder10@convex1.TCS.Tulane.EDU

==
3.2) What is INFO-A8?

If you do not have Usenet access, but you are on BITNET, you can access this group through the INFO-A8 listserv.

The BITNET subscription commands are:

tell listserv at marist register <your real full name>
tell listserv at marist subscribe info-a8

This is not a standard BITNET mailing list. It is a distribution of the Internet's Info-Atari8 Digest. In order to send mail to all of the subscribers, both in BITNET and the other networks you should not send your mail to the BITNET address (INFO-A8@MARIST) but instead send to the Internet address: mailto:comp-sys-atari-8bit@cs.utexas.edu.

You may leave the list at any time by sending a "SIGNOFF INFO-A8" command to LISTSERV@MARIST. Please note that this command must NOT be sent to the BITNET list address INFO-A8@MARIST or to mailto:comp-sys-atari-8bit@cs.utexas.edu, but to the LISTSERV address LISTSERV@MARIST.

Contributions sent to this list are automatically archived. You can obtain a list of the available archive files by sending an "INDEX INFO-A8" command to LISTSERV@MARIST. These files can then be retrieved by means of a "GET INFO-A8 filetype" command, or using the database search facilities of LISTSERV. Send an "INFO DATABASE" command for more information on the latter.

Please note that it is presently possible for anybody to determine that you are signed up to the list through the use of the "REVIEW" command, which returns the network address and name of all the subscribers. If you do not wish your name to be available to others in this fashion, just issue a "SET INFO-A8 CONCEAL" command to LISTSERV@MARIST. More information on LISTSERV commands can be found in the "General Introduction guide", which you can retrieve by sending an "INFO GENINTRO" command to LISTSERV@MARIST.

The INFO-A8 maintainers (not moderators) are:
HARRY@MARIST (A Harry Williams)
mailto:RAVI@SPEEDY.MCNC.ORG (Ravi Subrahmanyan)
mailto:RAVI@MCNC.ORG (Ravi Subrahmanyan)
mailto:BILLW@SCORE.STANFORD.EDU (Bill Westfield)

INFO-A8 was created on December 9, 1986.

==
3.3) How can I access the Merit/UMich Archive by e-mail?

Downloading - BART

Brode's Archive Retrieval Thang - the Merit/UMich Archive e-mail file server

To learn about using BART to access the Merit/UMich Archive, send
e-mail to: mailto:atari@atari.archive.umich.edu. The subject of the
message doesn't matter, but let the body of your message be:

help
send 8bit/0index

If you receive nothing within a day (it should take just a few minutes),
try including a line of this form:

path [your e-mail address]

BART automatically uuencodes binary files (so they may be mailed over the
Internet) and splits up large files into parts of about 30K or less.

Uploading

Simply uuencode the file, (please split it into parts of 60 K or less)
and mail the result to mailto:lenn@atari.archive.umich.edu. Please name
the parts in the subject line. This is really helpful as the parts
usually don't arrive in the proper sequence. Also, please include a
message labeled "file transmission," containing a short description of
the file, etc. Shar files are also acceptable, but uuencoded is preferred.

==
3.4) How can I retrieve files from FTP sites by e-mail?

There are several general-purpose FTP mail-servers. These may be used to
retrieve any files available from anonymous FTP sites on the Internet.

1) mailto:ftpmail@decwrl.dec.com with no subject line, and two-line
body with line one help and line 2 quit

2) mailto:ftpmail@grasp.insa-lyon.fr (body: help) Please, European
users only.

3) mailto:bitftp@pucc.princeton.edu (body: help or ftplist for a
list of anonymous ftp sites)

4) mail BITFTP@DEARN or to mailto:BITFTP@vm.gmd.de (body: help or
ftplist for a list of anonymous ftp sites) (Europe only)

==
3.5) How can I post to Usenet newsgroups by e-mail?

Given a Usenet newsgroup name in the form news.group.name, you have at
least these two choices:

a) mailto:news-group-name@cs.utexas.edu

b) mailto:news.group.name@decwrl.dec.com

Mail-to-news gateways of this sort tend to be overloaded.
Therefore, please do not use these gateways or any other similar

gateways if you can post to Usenet directly.

==========
4.1) How can I access the Merit/UMich Archive by FTP?

The Merit/University of Michigan Software Archives hold a huge number of files for many computing platforms, including the Atari 8-bit computers. Our 8-bit Atari Archivist is Jody Lenn, mailto:lenn@atari.archive.umich.edu; the Atari Archive as a whole is maintained by Mickey Boyd, mailto:boydm@atari.archive.umich.edu. The best way to contact the Atari Archivists is mailto:atari-archivists@atari.archive.umich.edu.

The convention for Anonymous FTP sites is to accept "anonymous" as your user name, and your e-mail address as your password. All of the following FTP sites follow this convention.

Downloading

(Try the site nearest you first)

a) ftp://atari.archive.umich.edu/atari/8bit
(141.211.120.11, United States)

b) ftp://wuarchive.wustl.edu/mirrors/archive.umich.edu/atari/8bit
(128.252.135.4, United States)

c) ftp://src.doc.ic.ac.uk/computing/systems/atari/umich/8bit
(146.169.2.10, Great Britain)

d)
ftp://info2.rus.uni-stuttgart.de/afs/umich.edu/group/itd/archive/atari/8bit
(129.69.8.13, Germany)

e) ftp://nic.switch.ch/mirror/atari/8bit
(130.59.1.40, Switzerland)

Remember to set file type to BINARY when downloading non-text files (.arc, .com, .dcm, etc.) by FTP.

Uploading

Place uploads in:
ftp://atari.archive.umich.edu/atari/8bit/New
(141.211.120.11, United States)

No uploads may be made to the Archive's mirror sites.

Remember to set file type to BINARY when uploading non-text files (.arc, .com, .dcm, etc.) by FTP. Also, please upload a short .text file describing what your upload is, so our 8-Bit Archivist will be sure to place it in an appropriate permanent directory.

Note that the atari/8bit/New directory is "write-only."

Newly uploaded items may be found in
ftp://atari.archive.umich.edu/atari/8bit/Newitems

==========
4.2) What is the Boston Archive?

Here's an 8-bit Atari FTP site located at Boston
University. It is maintained by Adam Bryant, mailto:adb@albert.bu.edu.

ftp://cs-ftp.bu.edu/PC/ATARI (128.197.13.20, United States)
(user name "anonymous"; password is your e-mail address)

==========
4.3) What is the PVV Archive?

This is an Atari FTP site maintained by Eyvind Bernhardsen,
mailto:eyvind@lise.unit.no. PVV stands for ProgramVareVerstedet, or The
Software Workshop, a student society at the University of Trondheim, Norway.

ftp://nova.pvv.unit.no/pub/Atari/8bit (129.241.36.207)
(user name "anonymous"; password is your e-mail address)

Uploads go to ftp://nova.pvv.unit.no/incoming/atari/8bit; Eyvind moves
them to the appropriate directory. Please include a .readme file with
each upload, so people know what they're downloading.

==========
4.4) What is the ClarkNet Archive?

This 8-bit Atari FTP site is maintained by Kevin Atkinson,
mailto:kevina@clark.net

ftp://ftp.clark.net/pub/atari
(user name "anonymous"; password is your e-mail address)

==========
5.1) What is the Cleveland Free-Net Atari SIG?

The Cleveland Free-Net is like a huge public bulletin board system,
and it is the hub system of the NPTN, the National Public Telecomputing
Network. Those persons with full Internet access can TELNET (this does
not mean FTP) to telnet://freenet-in-a.cwru.edu,
telnet://freenet-in-b.cwru.edu, or telnet://freenet-in-c.cwru.edu
(129.22.8.32, 129.22.8.51). Applications for free accounts are handled
online, or you may browse the system as a visitor. Once logged-in, type
"go atari" to reach the Atari SIG. Those who add their names to the Atari
SIG user directories are automatically members of the official Atari user
group C.A.I.N. - Central Atari Information Network. Send correspondence
and press releases to mailto:xx004@cleveland.freenet.edu. The Atari SIG's
8-Bit Computers Support Area is maintained by Michael Current,
mailto:aa700@cleveland.freenet.edu, the 8-Bit Technical Forum is
maintained by Craig Lisowski, mailto:aa853@cleveland.freenet.edu, and the
Atari SIG Manager is Len Stys, mailto:aa399@cleveland.freenet.edu.

==========
5.2) What is the Youngstown Free-Net Atari SIG?

Youngstown Free-Net (Youngstown, Ohio USA)
telnet://visitor@yfn.ysu.edu (192.55.234.27)
Via Modem: 216/742-3072

Youngstown Free-Net Atari SIGOps:

Joe Perkins (mailto:ac742@yfn.ysu.edu)
Joe Sabatino (mailto:ab588@yfn.ysu.edu)

Atari SIG (mailto:xx140@yfn.ysu.edu)

==========
5.3) What is the National Capital Free-Net Atari SIG?

National Capital Free-Net (Ottawa, Canada)
telnet://guest@freenet.carleton.ca (134.117.1.25)
Via Modem: 613/780-3733

National Capital Free-Net Atari SIGOp:

Christopher Browne (mailto:aa454@Freenet.carleton.ca)

==========
6.1) How can I retrieve files from the Merit/UMich Archive through Gopher?

The Merit/UMich Archive has a native Gopher server. Try

gopher://gopher.archive.merit.edu:7055/11/atari/8bit

to connect directly to the Merit/UMich Archive's 8-bit Atari directory. I personally recommend this method for downloading from the Merit/UMich Archive.

There is also a mirror archive site with a Gopher server:

gopher://src.doc.ic.ac.uk/11/computing/systems/atari/umich/8bit

==========
7.1) What is the Atari Classic Homepage?

Maintained by Eyvind Bernhardsen, mailto:eyvind@pvv.unit.no. Point your Web client to:

http://www.pvv.unit.no/~eyvind/atari/

==========
7.2) What is the Atari 8-Bit Home Page?

Run by mailto:ipoorten@cs.vu.nl (Ivo van Poorten). The URL is:

http://www.cs.vu.nl/~ipoorten/8bit.html

==========
7.3) What is the Atari 8-Bit Resort?

This one is kept by mailto:un55@rz.uni-karlsruhe.de, Marek Tomczyk. URL:

http://rzstud1.rz.uni-karlsruhe.de/~un55/8bit.html

==========
7.4) What is the Atari 8bit Home Page?

This home page is kept by Tomasz Tatar, mailto:tatar@student.uci.agh.edu.pl

http://www.uci.agh.edu.pl/student/robo1grp/tatar/public_html/atari/hp.html

==========
7.5) How can I access the Merit/UMich Archive by AFS?

Downloading

Just cd /afs/umich.edu/group/itd/archive/atari/8bit
[What is the propsero:// URL for this?]

Uploading

==========
9.1) What's this UUEncoding stuff (.uu, .uue files) all about?

UUEncode/UUdecode is a UNIX utility that will convert a binary file into
100% printable ASCII characters, so that the file may be posted or e-mailed
anywhere a text message can go. The 8-bit Atari is perfectly capable of
UUEncoding/UUdecoding as well. On the archives:

Uudecode 1.2a by John Sangster - very functional.
Merit/UMich: Archivers/uudecode.bas, Archivers/uudecode.doc
Boston: comm/uudecode.lst, comm/uudecode.doc

Yet Another UU-coder by John Dunning - both decoding/encoding.
Merit/UMich: Archivers/yau.arc
Boston: comm/yau.uue, comm/yaue.uue, comm/yau.doc

Uudecode.com, Uuencode.com by ??? - "newer, cleaner, easier to use."
Merit/UMich: Utilities/uue.arc

Dumas UU-coder by John Dunning - should work w/BART-style split files.
Merit/UMich: Cc65/dumasuu.arc

==========
9.2) What is an .arc file?

A file with the extender .arc has been archived in a standard manner that
is common in the MS-DOS world. This is done to make the file shorter,
so it takes up less space on your disk and it takes less time to transfer
between computers. The archives contains several 8-bit Atari archivers
fully compatible with this standard, including:

Super Un-Arc 2.3, Super Arc 2.0 by Bob Puff - highly recommended.
Merit/UMich: Archivers/superarc.arc - both Super Un-Arc & Super Arc
Archivers/suprarc2.arc - Super Arc
Archivers/supunarc.com - Super Un-Arc
Archivers/supunarc.uue - Super Un-Arc
Boston: {comm,util}/superarc.uue, {comm,util}/superarc.doc

==========
9.3) Okay, how about a .dcm file?

A .dcm file is a format unique to the 8-bit Atari which is used to convert
entire disk images into files. To work with .dcm files you'll need:

Disk Communicator 3.2 by Bob Puff.
Merit/UMich: Archivers/dskcom32.arc or Archivers/diskcomm.arc (same thing!)
Boston: {util,comm}/superarc.uue

==========
10.1) What 8-bit Atari emulators exist for other computing platforms?

These are the emulators that are usable.

1) ST Xformer 2.55, from Branch Always Software
a freeware 8-bit Atari emulator for the Atari ST.
Merit/UMich: /atari/Emulators/stxf255.lzh

2) PC Xformer 2.0, from Branch Always Software
a freeware 8-bit Atari emulator for DOS/Windows/OS/2.
Merit/UMich: Xf2/xf2.zip
ClarkNet: /systems/msdos/emulators/xf2.zip

==========
11.1) What are the best telecommunications programs available?

Here are some of the more popular PD/shareware terminal programs
available on the archives:

BobTerm, shareware by Bob Puff
Emulates: VT52
Text: 40 columns in gr.0; 80 col. w/ XEP80
File Xfer: XMODEM, YMODEM, FMODEM
Autodial: Yes
Archive filename:

ftp://atari.archive.umich.edu/atari/8bit/Telecomm/bterm12.arc

Kermit-65, public domain by John Dunning
Emulates: VT100
Text: 40 columns in gr.0; 80 col. in gr.8; 80 col. w/ XEP80 (sort of)
File Xfer: Kermit
Autodial: No
Archive filenames:
ftp://atari.archive.umich.edu/atari/8bit/Telecomm/k65v37.arc - latest version
ftp://atari.archive.umich.edu/atari/8bit/Telecomm/k65doc.arc - documentation
ftp://atari.archive.umich.edu/atari/8bit/Telecomm/k65src.arc - source code

OmniCom by CDY Consulting
Emulates: VT100
Text: 80 columns in gr.8
File Xfer: XMODEM, Kermit
Autodial: No
Archive filename:
ftp://atari.archive.umich.edu/atari/8bit/Telecomm/omnicom.arc

VT850, shareware by Curtis Laser
Emulates: VT100/VT102 (plus complete VT220 keymap)
Text: 40 columns in gr.0; 80 col. w/ XEP80
File Xfer: none
Autodial: No
Archive filename:
ftp://atari.archive.umich.edu/atari/8bit/Telecomm/vt850b1.arc

==========
11.2) Can I read/write 8-bit Atari disks on an IBM-PC?

There are several programs on the archives of this variety. Note
that these require a DOS and disk drive on the Atari end capable of the SS/DD
180K format (SpartaDOS, MYDOS, etc.; XF551, Indus GT, etc.). The programs are:

ATARIO by Dave Brandman w/ Kevin White - Reads SS/DD 180K Atari disks.
Merit/UMich: Diskutils/atario21.arc

SpartaRead by Oscar Fowler - Reads SS/DD 180K SpartaDOS disks.
Merit/UMich: Diskutils/sr.arc

UTIL by Charles Marslett - Reads/Writes SS/DD 180K Atari disks. See MyUTIL.
Merit/UMich: Diskutils/dskutil.arc
(Older versions are contained in pcxfer.arc, util.arc, and ataridsk.arc)

MyUTIL by Charles Marslett and Mark Vallevand - Try this one first!
Merit/UMich: Diskutils/myutil.zip
PVV: utilities/disk/myutil.zip

==========
11.3) Can I read/write DOS disks on an 8-bit Atari?

If your highest-capacity floppy drive on your Atari system is the
Atari 1050, you won't be able to use ATARIO, SpartaRead, or UTIL. You

still have the following alternative:

Mule by Rick Cortese - Read/Write 180K MS-DOS disks with an Atari 1050
drive or equivalent. Very limited.
Merit/UMich: Diskutils/mule.arc, Diskutils/mule.exe, Diskutils/mule.txt

==========
11.4) How do I transfer files using a null modem cable?

This section by mailto:cb541@cleveland.Freenet.Edu (James R. Gilbert)

A: Simply put, you need a terminal program and an RS 232 port on
each computer. The RS 232 ports need to be connected
together using a 'null modem cable'.

For up to 4800 bps, no flow control lines need be
connected. Just cross the transmit and receive lines
and join the grounds together. (Transmit is pin #2,
receive is pin #3 and ground is pin #7 on the 25-pin
port.)

The right hand pin on the 'long' side of a female 'D'
connector is #1. There are 13 holes on this 'long'
side, 12 holes on the 'short' side. The numbers go from
#1 on the right to #13 on the left on the 'long' side
and from #14 to #25 from right to left on the 'short'
side. #25 is closest to being under #13. A male
connector is the mirror image of this.

Most terminal programs allow a null connection, without a
carrier detect. Notably, '850 Express!' does not.

A convenient way to make a null modem cable, up to about
30 feet long, is to use two female DB25 connectors and
some three or more conductor cable. Using the two DB25
female connectors allows unplugging your modem and
plugging in the null modem cable. This also avoids the
confusion of the wide variety of serial port jacks on
different computers. Almost all computers connect into
the modem via a DB25 connection.

The SIO port on the Atari cannot be used directly. An
850 Interface Module, P:R:Connection, Multi I/O, Black
Box (by Computer Software Services) or similar device
that provides an RS232 port must be used.

On the Atari, the port is a female DB9. So you need a
male DB9 to male DB25 modem cable to connect to your
modem. So why not use this cable as your null modem
cable as well?

For higher speed connections, above about 9600 bps on the
8-bit, you need the flow control lines. You also need
a Multi I/O or Black Box, which use the PBI (parallel bus),

then you can go higher than 9600 bps.

Following are pin assignments for a DB25 pin RS 232 C
port.
13 1
o o o o o o o o o o o o o
o o o o o o o o o o o o
25 14

(Above is female, male is mirror image.)

1. Protective Ground 12. Select Alternate Rate
2. Transmit Data 15. Transmit Clock (sync)
3. Receive Data 17. Receive clock (sync)
4. RTS (Request to Send) 20. Data Terminal Ready
5. CTS (Clear to Send) 22. Ring indicator
6. Data Set Ready 23. Select Alternate Rate
7. Signal Ground 24. Transmit Clock
8. Carrier Detect

A high speed cable would need not only pins 2 and 3 crossed
but also pins 4 and 5 as well as 6 and 8. Or better
yet, make a true 25 wire, straight through cable and use
a commercial null modem. A commercial null modem is
just a small device with the correct lines already
crossed.

(DTE = Data Terminal Equipment, i.e., your computer.
DCE = Data Communications Equipment, i.e., your modem.)

==========
12.1) What 5.25" floppy disk drives are available?

original by: mailto:Krishna@max.tiac.net (Glenn M. Saunders)

--KEY---------------
*=my recommendations
**=good for easy mass storage, but slow
***=same as ** but with nice Z80 CP/M system in which CP/M drive acccess
is parallel only thus faster.

==========
12.2) How can I use 3.5" floppy disks with my 8-bit Atari?

to be written. volunteers?

==========
12.3) What do I need to connect a hard drive to my 8-bit Atari?

original my mailto:Krishna@max.tiac.net (Glenn M. Saunders)

Corvus ? 10 megabytes Fast but still relatively
slow I/O, kludge through
joystick ports for 800.
Rare
Supra/K-P N/A various Some limitations on drive
type and size and total
number of drives in sys.
FTe Multi I/O various 256 byter per sector
restriction. 256K and
1 meg ramdisk models.

Printer and modem, modem
will handle 14.4K baud
CSS Black Box various Will handle all SCSI drives.
Allows 9 drive access for
MYDOS. Currently the only
modem interface with CTS/RTS
hardware flow control. 19.2K
ready.
SWP ATR-8000 unknown limits Rare daughterboard for hard
drives. I/O is probably
fairly slow on this baby and
there may be DOS restrictions.

==========
12.4) How can I use an IBM-PC as a storage device for my Atari?

Original by Dave Paterson, mailto:d.paterson2@genie.geis.com

SIO2PC is a cable and software combination that lets you use your PC as up to 4 drives for your 8-bit. Drives can be SD, ED, DD or custom sizes up to 16 megs. SIO2PC also lets you redirect the printer output to your PC printer or to a file on the PC. High speed drives are emulated (a la US Doubler).

All these functions are transparent at the Atari end; you never notice the difference between SIO2PC and regular drives, except that the SIO2PC drives are faster than any others (except Ramdisks and PBI interface drives).

SIO2PC 3.18i is shareware by Nick Kennedy.
Merit/UMich: Sio2pc/sio2pc38.exe
PVV: sio2pc/sio2pc38.lzh

==========
13.1) What's the best DOS for the Atari?

This is a matter of opinion, but general consensus is that all 8-bit Atari users should treat themselves to either MYDOS or SpartaDOS to appreciate the power of the system. MYDOS is modelled after Atari DOS 2.0S/2.5, but provides subdirectory and hard-drive support. SpartaDOS is a completely different command-line DOS modelled after MS-DOS, though it is perfectly capable of reading all Atari DOS and MYDOS disks. SpartaDOS 3.2g is disk-based; SpartaDOS X 4.21 is cartridge-based and includes many additional features. SpartaDOS is available from Fine Tooned Engineering (see companion vendor/ developer list); MYDOS 4.53 is freeware from Wordmark Systems (Charles Marslett and Bob Puff).
It is recommended that all 8-bit Atari users own at least DOS 2.5 for complete compatibility with existing software, and then choose either SpartaDOS or MYDOS as they see fit. DOS 2.5, MYDOS and SpartaDOS are all available on the archives.
Merit/UMich: Fte/fte32g.arc (SpartaDOS)
Merit/UMich: Os/mydos453.dcm (MYDOS)

==========
13.2) What hardware has Atari created in the 8-bit computer line?

Computers:
400 Personal Computer (1979) 8-16K, membrane keyboard, 400/800 OS
800 Personal Computer (1979) 8-48K, two cartridge slots, 400/800 OS
1200XL (1982) 64K, early XL OS, F1-F4 keys, 4 LEDs
600XL (1983) 16-64K, BASIC, PBI, XL OS
800XL (1983) 64K, BASIC, PBI, XL OS
800XE (1987?)same as 130XE but 64K. Mostly eastern Europe.
65XE (1985) same as 800XL minus PBI
130XE (1985) same as 65XE with 128K plus ECI
XE Game System (1987) same as 65XE plus Missle Command, detach. keybd.

Peripherals:
410 Program Recorder -Japan and Hong Kong versions
810 Disk Drive -SS/SD 90K with DOS 1 or DOS 2.0S,MPI&Tandon vers.
820 Printer -40 col.
822 Thermal Printer -40 col.
825 80-Column Printer -req. 850
830 Acoustic Modem -300 baud req. 850, with Telelink I
835 Modem -300 baud, with Telelink II
850 Interface Module -4 9-pin serial, 1 15-pin parallel ports, beige &
black metal versions
1010 Program Recorder -Sanyo and Chelco versions
1020 Color Printer -40 col., print/plot in 4 colors
1025 80-Column Printer -7-pin dot matrix
1027 Letter-Quality Printer-80 col., letter quality
1029 Printer -7-pin dot matrix, same as Commodore MPS-801
1030 Direct Connect Modem -300 baud, with ModemLink
1050 Disk Drive -SS/ED 128K with DOS 3 or DOS 2.5
XC11 Program Recorder
XC12 Program Recorder
XM301 Modem -300 baud, with XE Term
XMM801 Printer -80 col.
XDM121 Printer -80 col., letter quality
XF551 Disk Drive -DS/DD 360K with DOS XE
XEP80 Interface Module -80 col. video display and DB25 parallel port
SX212 Modem -1200 baud, rarely with SX-Express! package

Atari 8-bit vaporware computers: (note some are more vaporous than others)
1200 1200XL internally, many slight cosmetic differences
800XLF 800XL incorporating a FREDDY chip (as in the XE's)
1250XLD Earlier concept of the 1450XLD
1400XL 800XL plus modem, speech synth.(looks like a 1200XL)
1450XL Earlier concept of the 1450XLD
1450XLD 1400XL plus 5.25" floppy drive
65XEP 65XE plus 3.5" floppy drive, 5" green monitor
65XEM 65XE plus AMIE sound chip

Atari 8-bit vaporware peripherals:(note some are more vaporous than others)
815 Dual Disk Drive -2 x SS/DD 180K with DOS 2.0D

1064 -64K RAM module for 600XL
1090 XL Expansion System-for PBI, CP/M/MS-DOS/Apple II compatible
XM128 -12" green monitor w/ built-in 80-column card
XC1411 -composite 14" color monitor
XF521 -5.25" floppy drive - 1050 compatible, in XE style
XTM201 -non-impact printer
XTC201 -non-impact color printer

==========
14.1) What product developers or vendors support the 8-bit Atari?

There are two files available:

1) Atari 8-Bit Computers: Vendors and Developers
Available from:
ftp://rtfm.mit.edu/pub/usenet-by-group/news.answers/atari-8-bit/vendev
http://www.cis.ohio-state.edu/hypertext/faq/usenet/atari-8-bit/vendev/faq.html
news:comp.sys.atari.8bit, news:comp.answers, news:news.answers
mailto:mcurrent@carleton.edu
and all other archives of Usenet FAQ lists.

2) "The Official **AC** Vendor List" is maintained by Atari Classics
magazine's Advertising Editor, Bob Scholar,
mailto:r.scholar@genie.geis.com. This list focuses on North America, but
all sources listed have been personally confirmed by the AC staff.

==========
14.2) Where is my nearest 8-bit Atari BBS?

The "ATARI CLASSICS Atari Bulletin Board System listing" is
maintained by Lawrence Estep, AC's Telecommunications Editor,
mailto:71450.1050@compuserve.com.

==========
14.3) Where is my nearest 8-bit Atari user group?

An 8-bit Atari user group listing is maintained by Atari Classics
magazine's Exchange Editor, James King, mailto:KAMARO_KID@delphi.com.

==========
14.4) How do I use my new or emulated Atari?

"The Unofficial Atari 8bit News / Stupid Question / Emulator Help FAQ" is
maintained by Bill Kendrick, mailto:kendrick@vax.sonoma.edu. You can
write to Bill at New Breed Software, 59 Palm Lane, Novato, CA 94945.

Welcome to the comp.sys.atari.8bit/Info-Atari8 Digest/INFO-A8 discussion group!

Atari 8-Bit Computers

Vendors and Developers List

Revised 27-Aug-94

Additions/suggestions/comments/corrections having to do with this
Vendor/Developer List are requested. Please send to:

Michael D. Current
mailto:mcurrent@carleton.edu
UUCP: ...!umn-cs!ccnfld!mcurrent
Cleveland Free-Net: aa700

Where to get the latest copy of the Atari 8-Bit Computers
Vendors and Developers List:

ftp://rtfm.mit.edu/pub/usenet-by-group/news.answers/atari-8-bit/vendev
(and many other FTP sites that archive Usenet FAQ Lists)
http://www.cis.ohio-state.edu/hypertext/faq/usenet/atari-8-bit/vendev/faq.html
news:comp.sys.atari.8bit, news:comp.answers, news:news.answers

or, send a message to mailto:mail-server@rtfm.mit.edu that says:

send usenet/news.answers/atari-8-bit/vendev
quit

Finally, you can always ask me for a copy at mailto:mcurrent@carleton.edu

================================================================

"All" commercial vendors and developers should be listed here. "Major"
shareware developers are also listed.

8-bit Atari magazines, both print and disk, are covered in the 8-Bit Atari
FAQ List, available separately.

GEnie, Delphi and CompuServe addresses can be accessed via the Internet:
Genie users are Genie.name@genie.geis.com
CIS users are #####.####@compuserve.com
Delphi users are delphiname@delphi.com
```

Telephone number coversion table:
2=ABC 3=DEF 4=GHI 5=JKL 6=MNO 7=PRS 8=TUV 9=WXY

When writing to request catalogs, it's always a good idea to include a Self-Addressed Stamped Envelope.

When writing to foreign firms, try enclosing a couple of International Reply Coupons (IRC's) as well.

Special thanks to Dave Paterson, GEn: D.PATERSON2, for his efforts at confirming the entire contents of this list in 1994!

==========

This list won't be accurate and complete without YOUR help!

4984. IceT - wanna post it

Newsgroup: comp.sys.atari.8bit
Date: 1994-08-30 23:11:17 UTC
From: bruck@brachot.jct.ac.il
Message-ID: <9408302310.AA11025@brachot.jct.ac.il>
Source record: 98656

I want to upload the current, slightly buggy, but better, version of Ice-T.

This I will do, as soon as someone answers this question:

When downloading Xmodem (128-byte, vanilla type) through Ice-T, text files
pass through glitchlessly, but whenever I try to get a binary file
(8-bit data), it gets the first packet fine, but the checksum is wrong
in the second packet, and it just retries till it gives up.

I know that 8-bit data IS coming through, and that no "translation" is
being done by the R: handler. I also tried playing with the settings
of the remote host, and it didn't help.

If I don't get any help with this, Ice-T will have an Xmodem text downloader
only... :(

```
You'd have to be a little more specific. For one thing, you mentioned
D9: & at least through version 3.17 or so, only drives 1-4 are supported.
If all you need to do is see if a drive is there, just issue a open for
directory read from basic & trap any errors; no directory => no drive.
```

4986. Re: Can I use Sio2pc on 286-PC??

Source record: 98660

Hi, all. And I thank to all who answered me. :)

OK, I see. Sio2pc can run on 8086/8MHz.
To tell the details, there is a PC called "TeraDrive" in Japan.
It has 80286. And it has MEGADRIVE(GENESYS) in it.
Yes, it has 80286(for PC), 68000 and Z80(for MEGADRIVE/GENESYS).
TeraDrive is true PC and I found out a man who want to sell it by
20,000yen(USD$200). I am thinking I want to buy it for Sio2pc.

And I can play "Indy 500mile" on it. :)

My Atari130xe still isn't arrived. I mailed him who sold it to
me, but I still don't receive his reply now.

OK, thanks!!

Source record: 98663

While the 6502 fails to meat today's specific criteria for RISC operation, it was definitely designed with the RISC state-of-mind for its time. To me, the concept of RISC assumes that most of the time a CPU is executing the most basic of operations. Complex opcodes, even when they are provided, are used much less often. Thus, optimum performance is acheived by making the basic stuff as fast as possible, and not worrying about losing out in some of the complex stuff. I beleive in this design philosophy, and think RISC always comes out way ahead.

I've written both 6502 and Z80 code. While source code on the Z80 may turn out marginally smaller due to the CISC nature, the object code was definitely bigger. All 6502 opcodes are one byte, where many Z80 opcodes were two bytes. Another factor, is that zero-page, and some of the excellent abilities to directly access memory for certain instructions, (where the Z80 required an indirect pointer to memory), all effectively reduced the object code size. The 65816 is even more efficient, utilizing 255 out of the 256 available instructions, and it is the most efficient processor in terms of code size that I have run across.

There have been some comments about RISC, pipelining, and micro-code that address the 6502 speed in executing instructions, but so far, no one has explained why the memory fetch only takes one cycle. Advanced 68000 CPUs have pipelining and streamlined architecture than can execute instructions in just one cycle. But they still slow down to that same 4 cycle wait when doing a memory fetch. Atari's nifty RISC CPU in the Jaguar has a similarly long time to access RAM. So what causes the holdup, and why can a chip as old as the 6502 do it in one cycle?

I just reread Brent's comment about pipelining allowing the chip to load RAM into a buffer. I also looked again at the 6502 specs. The detailed intruction timing still shows that the memory byte can be fetched the very next cycle after fetching the address bytes, which would seem to eliminate pipelining as a solution. The book describes the pipelining process as being able to execute internal CPU operations while the memory fetch is taking place, but still states the memory fetch takes only one cycle.

Hey! V.3.15i of SIO2PC supports any drive numbers from 1-8 (and up to 4 drives
.. doesnt make too much sense, that...)

Also, sometimes if MyDOS isnt set up for D9: as a RAMDisk, and I try ot
access D9:.. SIO2PC starts going weird.. and it says its operating on
device "39" (hex) (9=the 9 in D9:, just as "31"="D1:", etc.)

weird

Yes that becuase sio2pc uses d9: for its remote program and when you
write to it sio2pc gets all weird...

read the docs and it tells you will see why..

4990. Re: ICE-term ?

Newsgroup: comp.sys.atari.8bit
Date: 1994-08-31 10:15:35 UTC
From: winston@merk.com
Message-ID: <CvE9u0.Myy@merk.com>
Source record: 98664

What is ICE-T ? Hmm... the best description for the beta-release of ICE-T that I can come up with is "KERMIT-65 put into overdrive". ICE-T gives you 80 columns at 4800 BPS or so, and uses drop-down menus similar to DE-TERM and TERM80 for changing the settings. It supports partial ISO graphics characters for drawing boxes and such. Essentially it is a "faster" VT100 emulator that uses ATARI display lists to handle screen mapping rather than resorting to bitwise updatng of the entire graphics page A LA C64 style (KERMIT-65 is a direct port of the C64 KERMIT-65 and uses none of the special ATARI graphics hardware for screen management). As far as I know, the beta-release of ICE-T is a faster VT100 emualtor that does text modes. There is no ANSI to my knowledge, yet, but keep in mind that this is a "work in progress" that is still under construction, as far as I know.

4991. [--- FORTH Editors ---]

Newsgroup: comp.sys.atari.8bit
Date: 1994-08-31 11:26:26 UTC
From: winston@merk.com
Message-ID: <CvED44.16K@merk.com>
Source record: 98666

I thought that I would go back and try some Forth, but ran into a problem. Is there any method for using a modern text editor like T:EDIT or TEXTPRO with one of those ancient Forth environments that uses their own DOS routines? Is there any way of replacing any of those clunky antiques with some faster inline code? One of the main advantages to having Forth is the ability to interpret and compile directly from inside of the editor. Losing this ability would be a major setback. Has anyone come up with a pratical solution to using these clunky Forth editor screens? (In ten years I would hope that someone has come up with a workable solution for a better 1K block editor than what the 1983 Forth packages provided.) Is this what resident DOSes are for, to jump in and out of DOS from Forth to DOS editor and back to Forth again? What is the pratical solution?
Thank you.

>The ports of original Apple games to the
>Atari 8-bit just did plot-and-replot, and inevitably lost a lot in
>the port because the Apple had more colors than the Atari, and
>also different joysticks.

Hmmm... I believe the Apple II sported 16 colors at best, and the Atari was way ahead on graphics over all the other 8-bits (C64, Apple, CGA/EGA) since its advanced graphics modes supported 256 colors. Many, many games look a LOT better on the Atari than the Apple versions, whether they were original to the Atari or not. And as a matter of preference, I like digital joysticks much better than the analog sticks on IBM and Apple. Arcade machines use mostly digital joysticks (or used to anyway).

Just my 2 cents.
David

4996. sio2pc problem

Newsgroup: comp.sys.atari.8bit
Date: 1994-08-31 12:59:09 UTC
From: "Robert R. Anschuetz II" <rra@orl1.orlando.loral.com>
Message-ID: <1994Aug31.125909.23356@wdl.loral.com>
Source record: 98670

In article <9408302306.AA11013@brachot.jct.ac.il> Elad Bruck,
bruck@brachot.jct.ac.il writes:
>I have an SIO2PC, and I use it with my 800 and 1200xl, alongside an 8088
>PC-XT.
>Once in a while, in the middle of loading something, it just pauses for
>5 seconds or so, then continues as if nothing had happened.
>This happens in the middle of getting a directory, during booting,
>while loading software, etc. It's the same on both my Ataris (I have no
>way to test this on other PCs).

I have the same problem with my 486-33, but only when WRITING to
SIO2PC, not reading from it. This made copying disks a lengthy procedure,
since it would copy about 12 sectors, then think for 5 seconds, then copy
5 more. I finally realized that if I hit the break key, it would wake my
800XL out of its sleep. I thought of this because this was a fix for my
400 when it went to sleep during IO transfer. On some programs, pressing
the break key causes the program to abort though (like with MYDOS copy
disk).

Oh, another thing I forgot. When I'm writing to SIO2PC running full speed
on my 486-33, the timeouts would be longer than 5 seconds, and the
timeouts would cause some programs to "give up". If I turned "turbo" off
on
my 486-33 (turning the clock down to who-knows-what speed), the sleep
periods would diminish to the 5 seconds I mentioned previously.

The funny thing is, I never have to slow down the clock or press break
when
reading from an SIO2PC disk, it's just writing that causes the problem.

I wonder if adjusting the timing parameters in the SIO2PC software would
fix any of this. I tried, but it didn't seem to make a difference.

Robert

4997. 8 Bit games in FTP archives.

Newsgroup: comp.sys.atari.8bit
Date: 1994-08-31 14:47:59 UTC
From: 932907da@cent.gla.ac.uk
Message-ID: <932907da.778344479@cent.gla.ac.uk>
Source record: 98686

I'm sure there's a flaw in this idea somewhere - there usually is:

Is it possible to e-mail files to FTP archives ? If it is, then it
may be possible to e-mail files via the anonymous mail server
in Finland (?) This would avoid possible legal comeback from
putting commercial games (which are no longer produced) on to the
archives. If I had the necessary cables, I might give it a go.

If you don't already have the details on how to contact the anon server,
then I'll post them to you if you ask me.

Gareth Davies.

: >the port because the Apple had more colors than the Atari, and
: >also different joysticks.

UNTRUE! The Apple II hi-res mode was goofy. 280x192 in mono. Color took two pixels, and there were only six colors! (black, white, green, purple, red and blue) There were two sets of b/w, one would clash with purple/green the other with red/blue... A nightmarish system.

I had an Apple before the Atari. Most games look many times better on the Atari, but not all ports took advantage of it. Here's one, Snake Byte... instead of using 4-voice sound, it pumped sound through the "buzzer" just like the Apple II version!

And most of the classics started on the Atari (IMHO).

5001. Power spec's, need help to complete!

Newsgroup: comp.sys.atari.8bit
Date: 1994-08-31 21:20:28 UTC
From: mcurrent@blue.weeg.uiowa.edu
Message-ID: <Pine.3.89.9408311626.A19843-0100000@blue.weeg.uiowa.edu>
Source record: 98675

Here's what I have so far. Please post or mail any comments, and help
fill in the missing info!

Power supply requirements for all 8-bit Atari computers and peripherals

The most important information is the voltage (in volts) required, and
whether you need a transformer (AC output) or an adapter (DC output). The
power (in watts) and current (in amperes) specifications of the original
equipment as presented here should be regarded as minimum values.
Higher-than-specified power and current capacities are entirely usable,
and often preferable because such supplies run cooler and last longer.

9 V AC 18 VA (2.0 A) transformer or
9 V AC 31 VA (3.4 A) transformer:
400,800,1200XL,810,822,850,1050,XF551

5 V DC 1.0 A (5.0 W) adapter or
5 V DC 1.5 A (7.5 W) adapter:
600XL,800XL,65XE,130XE,XE Game System

9 V DC 500 mA (4.5 W) adapter:
XEP80,SX212

9.5 V AC 40 VA (4.2 A) transformer:
1027

9 V AC 27 VA (3.0 A) transformer:
1025

These have internal power supplies:
410,820,825,1029,XC11,XC12

The power supply requirements for the following are still needed:
830 modem
835 modem
1010 program recorder
1020 printer/plotter
1030 modem
XDM121 printer
XMM801 printer
XM301 modem

5002. Sio2PC 319i

Newsgroup: comp.sys.atari.8bit
Date: 1994-08-31 23:36:18 UTC
From: snyder10@convex1.tcs.tulane.edu
Message-ID: <34345i$2pf@news.cs.tulane.edu>
Source record: 98677

The problem everyone has been having with the Sio2PC is due to a bug in the software. Nick is sending out an updated/fixed version of the software to all reg'd users of the Sio2PC. Anyway, I've just sent the fixed version to the archive (atari.archive.umich.edu) called sio319i.exe. This is a selfextracting file for your MsDos system. If you have any problems, please let me know and I'll either send you a copy of the software (if you can not get it from the archive) or pass your questions on to Nick the next time I talk to him.

```
Ladies and Gents, a new discovery has been made! You can type out ANSI
characters on AnsiTerm by doing the key combination of
<shift>+<atari/inverse key>. Then you can type out ANSI characters by
pressing just about any key on the board. Shift and number characters also
work. Get out of Ansi mode the same way you got in...

5004. Sparta X and Integrator

Newsgroup: comp.sys.atari.8bit
Date: 1994-09-01 04:07:57 UTC
From: bjcorr@delphi.com
Message-ID: <9409010002591.DLITE.bjcorr@delphi.com>
Source record: 98679

Can anyone tell me how to get Sparta X to work with an Integrator Board (a modified OS that has a built in interface for Axlon 128k boards and Corvus HD's on 800's). All my disk based dos's (except TopDos!) have no problemns with it, but SDX totally ignores the interface, wont even boot unless I try to get to the Integrator mini-menu by holding down OPTION while I boot up. Then it just ignores it! Seeing as how the patch to the Corvus is at the OS level I don't see how SDX can blow off the Integrator so casually! My integrator is a modified RamRod board, is this a FTE question? My old RamRod board with OSN6 and Omnimon never had a problemn! I even didled with SDX's config.sys file to make it behave better, no luck. AND, SDX (when I get it to work) tells me I have NO free banks of RAM and no ramdisk, then lets me format d:9!(But I only get 376 sectors on the Ramdisk) Weird.
I can certainly live with another dos, but SDX and a ramdisk and the Corvus would be SOOOO nice!
Any Sparta X Guru's out there?
Ben Corr - BJCORR@Delphi.com

5005. MASSIVE AUCTION II - update #6 (includes lots of Atari)

Newsgroup: comp.sys.atari.8bit
Date: 1994-09-01 07:13:26 UTC
From: dw901@cleveland.Freenet.Edu
Message-ID: <343uum$3rf@usenet.INS.CWRU.Edu>
Source record: 98680

SIXTH UPDATE!

I will be posting these updates every 24 hours. I will also try to send
E-mail to all bidders, if time allows. Please check the newsgroup on which
you read the auction message.

Also, I have used the first part of your E-mail address when listing bids.

****

Games and/or game systems included in this auction include:

ATARI 2600 ATARI 5200 ATARI 7800 ATARI 8-bit
ATARI LYNX COLECOVISION INTELLIVISION ODYSSEY2
SEGA MASTER SYSTEM TEXAS INSTRUMENTS TIMEX SINCLAIR

AUCTION RULES:
1) THE DEADLINE FOR BIDDING IS 11:59 P.M. EST, ON FRIDAY, SEPTEMBER 2ND.

2) MINIMUM BIDS ARE LISTED FOR EACH ITEM UP FOR AUCTION, MINIMUM INCREMENTS
ARE $0.50 ON GAMES AND $1.00 ON SYSTEMS.

3) NO PACKAGE DEALS ON GAMES OR SYSTEMS.

4) TRADE OFFERS WILL BE ENTERTAINED, BUT CASH OFFERS ARE GIVEN PRIORITY.

5) EVERYTHING IS SOLD AS IS. UNLESS SPECIFIED, ALL GAMES AND SYSTEMS HAVE
BEEN TESTED AND ARE IN WORKING ORDER.

6) BUYER PAYS ALL SHIPPING COSTS.

7) IN CASE OF TIES, FIRST BID RECEIVED WINS.

8) PLEASE DON'T MAKE A BID UNLESS YOU ARE PREPARED TO BUY AN ITEM.

9) PAYMENT MUST BE MADE IN U.S. FUNDS.

NOTE: ALL CARTRIDGES ARE LOOSE (IE. WITHOUT BOX AND MANUAL), UNLESS SPECIFIED.

*****

5006. Re: [--- FORTH Editors ---]

Newsgroup: comp.sys.atari.8bit
Date: 1994-09-01 10:37:09 UTC
From: paulvl@python.es.ele.tue.nl
Message-ID: <PAULVL.94Sep1123709@python.es.ele.tue.nl>
Source record: 98681

Currently ANS-FORTH is soon to be released, it specs
can be retrieved (PostScript document >200 pages) from
anonymous ftp.
ANS-FORTH is the new FORTH standard and it has words
to compile new words from source files, not FORTH blocks.
These source files you can edit with the editor of your
choice.
I don't know if this is allready implemented for your
system, but I'm currently working on a port for my
commodore 64 (6502 based).
Maybe there are some PD FORTH out there you can use.
I know of several PD FORTHs that are written in C
and can be compiled on several systems.

Greetings from Paul.

I have an original 810 drive that has been enhanced with the Atari archiver chip. Lots of software too -- carts and disks. Also an OKIMATE 10 color printer (if you can find the color ribbons, works great) with an Atari plug'n'play interface module. Also KoalaPad with software, WICO joystick, etc. All power supplies, cables, bag o' extras and goodies (cables,chips, ROMs, etc.)

810...$45
Oki 10...$45
Koala Pad...$30
Wico arcade stick...$10
Bag o' goodies and miscellaneous Atari books FREE when you buy 2 or more items!
Please respond via email to DAVIDN9000@aol.com

5009. Re: Sparta X and Integrator

Newsgroup: comp.sys.atari.8bit
Date: 1994-09-01 12:00:50 UTC
From: Russ.Gilbert@apk.wariat.org
Message-ID: <1994Sep01.075736.2340@wariat.UUCP>
Source record: 98684

(Ben asks about why his integrator board won't work with Sparta X.)
I'm not a guru, maybe John Harris will answer you. The OSNXL os is a
modified 800 os and uses C000 memory. So does Sparta X use C000. I
think there's a way to tell Sparta X to NOT use RAM under the OS. Then
it should work. Check your book.

It figures. Last week, or maybe the week before, someone posted here a summary of the power supplies used by the various Atari systems, peripherals, etc. I didn't need it at the time, but now I do. Anybody got a copy they could repost or mail me? Thanks in advance.

What I _Really_ need, in case it isn't in that list after all, is the specs on the power requirement for an Indus GT drive. (I could also use information on any "special features" of this drive, and any software required in order to use same.) Bought this puppy last week, used, without power supply, software, or docs. Oh well, what do I expect for $35 ? :-)

Chris

5012. Q: F-15 Eagle DOCS?

Newsgroup: comp.sys.atari.8bit

Yes, I know someone just posted that he's SELLING F-15 Eagle, WITH docs, but I'm asking on behalf of a friend who got the DISK, used, WITHOUT docs, and wants the docs WITHOUT having to buy the disk all over again (de-priving someone else of it, for one thing). Anybody got F-15 Eagle DOCS they'd be willing to send/explain?

Chris

All that means is that if the archive maintainer(s) are ever arrested for piracy, they won't be able to tell anyone who uploaded the games.

5014. Black Box with SpartaDos X 4.21 Query

Newsgroup: comp.sys.atari.8bit
Date: 1994-09-01 15:38:11 UTC
From: tdrake1@umbc.edu
Message-ID: <344sh3$1lb@news.umbc.edu>
Source record: 98690

Anybody out there using a 256K Newell 800XL with a Black Box and the SpartaDOS X 4.21 cartridge? Having a problem when using the cart with this combination...

Have the following setup...

Atari 800XL with 256K Newell Upgrade
Black Box

When I attempt to use SpartaDOS X 4.21 with this combination, the screen locks, with a lot of garbage displayed. Sometimes I get configuration errors. When the BB is removed the X cart works fine.

NOTE: The use of the BB and the X cart works fine on a STOCK 800XL and with expanded memory 130XEs.

Any ideas???

(Russ talks to Russ about Ben's SDX cart and integrator.)
Russ is wrong again. The OSNXL is ROM, so I tested it and SpartaDOS
3.2 works with it. I guess it (SD and Ramrod) the SD bank switches to
the RAM under the ROM and the omnimon in OSNXL is in ROM. Babble.

For the record, the 1802 (Cosmac Elf) was the first processor that I
actually owned (first one I personally used was the SWTPC 6800). I had
my old home-brew setup until about a year ago. I might still have some
of the old books...

5021. Huge Atari ST sale

Newsgroup: comp.sys.atari.8bit
Date: 1994-09-02 03:03:36 UTC
From: jrl8@bonjour.cc.columbia.edu
Message-ID: <3464m8$fcu@apakabar.cc.columbia.edu>
Source record: 98692
Cross-posted to: ny.forsale,nj.forsale,misc.forsale,comp.sys.atari.st,comp.sys.atari.8bit,rec.games.video.marketplace

I have the following Atari ST equipment for sale. I would like
to sell everything together, but would consider serious offers
to break up the systems. I've reduced my asking price to $600
for the entire lot. Game players take note --- there is
gold in the list below!

I *will* accept offers to break up the package.

Atari 1040ST computer system w/mouse (TOS in ROM), loose power
cable but works perfectly (includes built-in 3.5" drive)
Atari 520ST computer system w/mouse (TOS in ROM), works sometimes

2 Atari SC1224 color monitors
Atari SF354 single sided 3.5" disk drive

Supra 30 megabyte fast hard disk with NeoDesk operating system

All power cables, power supplies, and cables are included to
hook up everything.

The following software, all with original disks, boxes, and manuals:
Word Writer 2.0 Timeworks (barely used)
Timeworks Desktop publishing Timeworks (with bound manuals, never used)
Crazy Cars Titus
International Soccer Microdeal
Wizards Crown SSI
Questron II SSI
Heroes of the Lance SSI
SDI Cinemaware Interactive Movie
TetraQuest Microdeal
Prime Time First Row Software
Starglider Rainbird
Starglider II Rainbird
F15 Strike Eagle Microprose
Rings of Zilfin SSI
Speed Buggy Data East
Typhoon Thompson Broderbund
Guild of Thieves Rainbird
Outrun Sega
Captain Blood Mindscape, Inc.
Road Runner Mindscape, Inc.
Road Wars Electronic Arts
Obliterator Psygnosis
Sinbad Cinemaware Interactive Movie
Defender of the Crown Cinemaware Interactive Movie

Pinball Wizard Accolade
Bubble Ghost Accolade
Ultima IV Origin Systems (+ cluebook)
Dungeon Master FTL (no box)
Virus Rainbird (no docs)
Moebius Origin Systems (doesn't work)

The following software has original disks and manuals but no boxes:
Aegis Animator/ST Aegis
Impossible Mission 2 Epyx
ST Basic Atari
Flash Antic Software
Block Out California Dreams
SimCity Maxis
High Roller Mindscape
Time Bandit Michtron
Barbarian Psygnosis
Airball MicroDeal
Airball Construction Set MicroDeal
Skyfox EA
Neochrome Painting Program Atari
UMS Rainbird
ST Wars Miles Computing
Chaos Strikes Back FTL
Swiftar Accustar Software, Inc.

Plus dozens of other games (Rogue, Test Drive, Sundog, etc.) with
just original disks (no box or manuals), plus a TON of shareware
on disks, plus old Atari distribution disks (DB master one, megaroids,
languages, etc), plus an entire collection of START disks representing
about twenty issues.

There are also duplicates of some of the software (Dungeon
Master, Time Bandit, etc).

Please call or email if interested!

Best regards,
-JRL

I wonder if this is similar to what the 6809 can do. It has a
specific register that determines where "page 0" accesses go. This
can be a major headache if at runtime that register isn't set to what
you expected it to be.

(I'm not really back yet. Really. Soon, though.)

(ANSIterm=USELESS cuz cant go into 2400 says Glenn)

Ok.. let's get Itay to implement ANSI in Ice-T.. I have a hunch that FT80
can't because it's restricted to like 128 characters, right? ANSI
technically is

VT codes
+ IBM high ASCII (256 characters)
+ color (optional but helps a HELL of a lot)
+ music (optional probably rarely used)

Ice-T does VT codes, is high-speed (uses a fast scroller) and is in bitmapped
mode (characters limited only by the RAM and/or disk space (like CGS) avail-
able to hold the chsets.. or actually limited to 2000, because that's
all an 80 x 25 screen can hold ;))

If we could somehow incorporate CV8 mode into Ice-T or FT, we'd have COLOR!
(8 of them).. then I know FT has brights/blinkers (dunno how exactly..
brights are done with PMGfx, right???), so that's 16 and blinkers.. cool!

Of course, do CV modes work ok with R: handlers and could you go above
300 bps with one turned on!? ;)

(THEN we can start talking about settling with an ANSI OFFLINE viewer
which does color, bright, blink, etc... but for now, online would be
pretty cool :))

I just finished a class on programming the MIPS RISC architecture.
Some of its important characteristics:
- All instructions are 32 bits, including operands. Most actual
opcodes take 6 of those bits. The processor doesn't have to worry
about figuring out how long each instruction will be.

- 32 "general purpose" registers, a few of which are normally reserved
for special functions such as stack pointers.

- NO push/pull stack instructions. All stack manipulation must be
done by separately changing the stack pointer and storing/retrieving
the info. This is a real pain to program, but it makes multiple
pushes/pulls more efficient; you can change the pointer only once for
the whole batch, rather than once for each piece. (So N consecutive
pushes/pulls requires N+1 instructions that are harder to understand
that PHA or PLA.)

- It does have multiply and divide instructions, and built-in
floating-point, with a bunch of floating point registers. Does that make the
6502 more reduced than RISC?

Just thought you might be interested.

Ok.. thanks to DCM2DSK (YAY!) I got the SWEETB.DCM file into an ATR so I could boot it..

one problem

it doesnt boot.. it calls me a lamer and says to flip the disk and press reset or something

argh! :)

My problem is side A of the demo sorta crashes when it gets to the plasma demo (the vertical scrollers pop up and wham it goes nuts).. SHIFT doesnt do anything at ALL.. Console keys do nothing.. keyboard keys = nothing. RESET=reboot

damn

anyway to get to the demos on side B without using side A!?!?!?!

any hackers out there wanna try to fix this problem for me (and i'll guess all other NTSC users) !?!

:)

Minor point, but it might prevent frustration later: I think the
codes for the arrow keys are different between vt100 and ANSI.

This has made a lot of people very angry, and been widely regarded as a bad
move.

<deletion>

I agree. Since Zero-page addressing only takes one extra cycle over registers
it is like having 256 extra pseudo-registers except that all "T"ransfer
and "S"tore (others escape me at the moment) instructions need a real
register.

The 6502 solution was rather elegant and led to nice-tight opcodes. Ya know
what I don't understand: Atari also used the 65xx in the VCS (Stella) and
yet it only has a clock speed of 1.19 (.333 of the color clock) whereas the
400/800 uses 1.79 (.5 of the color clock) and is a nice divide by 2. The
divide by 3 in the VCS is not as easy a circuit to build. Maybe the 6502
wasn't as fast then? The fact that the VCS's TIA could not do any DMA really
eats up that CPU time. I have new respect for VCS programmers, especially
since the VCS doesn't even maintain TV frames itself(!).

Boy did I digress. :)

5029. Re: Top Ten 8bit Games was:8bit down

Newsgroup: comp.sys.atari.8bit
Date: 1994-09-02 06:20:29 UTC
From: jharris@cup.portal.com
Message-ID: <121448@cup.portal.com>
Source record: 98701

The thing is, if the code was ported from the Apple II, it was often ported in the hi-res mode, in which the Atari has only 4 colors to the Apple's 6. Any uses of dithering unfortunately widened that gap. Thus, those programs look worse on the Atari, but only because of not using the strongest points of the machine.

Code that starts on the Atari, looks much worse when converted to the Apple, by a much wider margin too. Thus, it depends on where the game originated, and whether it was ported directly in hi-res graphics, as to which version looked better.

Joysticks are a funny double-sided matter. There is no question that analog sticks are superior, since they return much more information, and always at least as much information as their digital counterparts. The hard part is, it takes some decent code to make the best use of them, and joystick interface code (or user interface code in general) is unquestionably the most neglected part of software design. That's really strange, because it is by far the most important part of a piece of software. I don't understand why most programmers don't seem to feel this way.

Anyway, as it turns out, poorly implemented analog interfaces can actually wind up much worse than a decent digital interface, but that is a fault of the code and not of the input device. I recently got a chance to play Wing Commander on an IBM, (actually Privateer) after already playing the Amiga version with a digital interface. In the Amiga version, it was hard to make fine adjustments for aiming, and I was really looking forward to flying with an analog stick. Sadly, Privateer's interface is one of the worst I've seen, and it was much harder to make fine adjustments than even the Amiga version. Sigh...

Still nothing beats a well designed analog stick interface. I just wish there were more examples of them.

You're completely right. Hmmm, lemme see here... Yeah, in the
Apple II History it mentions that the Revision 0 Apple IIs could
only handle four colors (black,white,violet,green), I've seen old
hi-res stuff that had that limitation. Woz figured out a way to add blue&red
and Rev 1 had it.

Wonder what he added? Anyway, Drol came over pretty good. Music
added, not as colorful but those fade-outs were neat.

: Code that starts on the Atari, looks much worse when converted to the
: Apple, by a much wider margin too. Thus, it depends on where the game
: originated, and whether it was ported directly in hi-res graphics, as to
: which version looked better.

I just read a review of "Archon Ultra", and the author fondly remembers
Apple II Archon... Ouch. After playing the Atari version on my cousin's
and coming home to my Apple it was a let down (except for that title
screen, wow, wish I kept a capture).

Best Electronics has a replacement power supply for the Indus. I
bought one about a year ago and if I remember correctly, paid $15 for
it.

(Chris Chiesa asks about Indus GT power supply.)
The power requirement list by M. Current is only Atari hardware.
The Indus GT takes a brick that looks like the 1050 brick and has the
same plug on the end. DO NOT interchange an Atari 9v AC power supply
with the Indus. The Indus is a 33 watt, output 1.95 amp 11.5v DC!
I have no idea how you can come up with a replacement supply.

>waits for the previous instruction to finish. Kind of like a Pentium.
>:)

The 6502 uses the two phases of the clock in ways that most CPUs don't.
During the first phase it indicates that it wants to read/write data and
tells where the source/destination is. On the second phase it actually
reads/writes the data.
Most other CPUs do not use their clock phases and thus have to indicate
the location where they want to read/write data in once cycle and then read/
write the data in the following cycle. Burst-mode transfers are faster in
that one cycle sets up the location of an intial read/write address and the
following cycles read/write the data from/to successive memory locations.
This requires a more complicated memory interface.

- Robin

Cool. (what were the main differences between the IIgs and the IIe?)
and what were the requirements for the unix os? =)

I wouldn't even know were to begin to even contemplate doing unix
for the 8bit... only to start all over and rewrite all the basic
BSD routines in assembly. That would be the only way to actually
have speed and space.

On a side note, I always wanted to port Unix to Pascal...
The Pascal Unix System. hehehehe That would be fun|||

There is a Unix for the Apple IIgs. I have seen it running on
a friend's machine (he's a big IIgs fan). I don't know anything more
about it. (I could give you his email address, though.)

The main difference between the IIgs and the IIe is that the gs has a
65816.

>I wouldn't even know were to begin to even contemplate doing unix
>for the 8bit... only to start all over and rewrite all the basic

>have speed and space.

Forget assembly, and forget speed and space. :-)
I guarantee that you could never do it with a stock Atari.
You also couldn't have some of the more modern unix niceties, such as
Emacs.
The starting point would be a (ANSI) C compiler, probably a port of
gcc, and a few defined standards for libraries. (I know we have C
compilers, but I think they'd choke on most code written for Unix.
The hp48 people already have a cross-compiler almost ready. (They're
not going for Unix, though, just C.)

> On a side note, I always wanted to port Unix to Pascal...
>The Pascal Unix System. hehehehe That would be fun|||

Um. Why? Pascal can't do as much as C.
("C -- all the power of assembly language combined with all the
readability of assembly language." - anon. :-)

Any machine that gets a solid ANSI C development package for it could potentially run one of the PD Unix systems out on FTP. It pretty much takes a 16-bit machine as a minimum, which is why the IIGS can do it.

Even if you get Unix to compile on an 816 Atari, I'm not sure the hardware would support the kind of multitasking which Unix wants to do, especially considering the Mhz problem.

Not only that, the custom disk format of Unix would wreak havok with the delicate hard drive systems we manage to get to work on the 8-bits. Unix mounts drives all on one common device. It would be a major undertaking...

5043. Atari Power Supply list

Newsgroup: comp.sys.atari.8bit
Date: 1994-09-03 02:24:49 UTC
From: Russ.Gilbert@apk.wariat.org
Message-ID: <1994Sep02.222408.2969@wariat.UUCP>
Source record: 98516

I originally started to e-mail Michael Current some
information about Atari power supplies I have. However, I
think this may be of general interest.
What I've found disturbs me as I have thought before 'If
it has the same plug, it must be ok to plug it in'. WRONG.
I found 3 different power supplies with the same plug. Plug
the wrong one in and SOMETHINGS GONNA BURN or if you're
lucky a fuse will blow.
The three items are a 1 meg MIO, Indus GT and the most
common of them all, the 9vac 1020, 800, do all brick
#CO17945.
The 1 meg MIO is a 9.3v DC, 1.95 amp.
(An ATARI power supply #CO18187)
The Indus GT is 11.5v DC, 1.95 amp.
The CO17945 is 9v ac, 3.4 amp.
All three have the same plug.
My 256k MIO uses the CO17945.

(Just to answer M. Current's question.)
1027 printer: #CO61636
9.5v ac output
40 va, 60 watts
The CO17945 came with my 1020s. I'm not sure about the 1010,
but pretty sure it also came with a CO17945.
The prettiest power supply I have is one with the 800xl
style black bottom and louvered off-white top supply for the
xl/xe. It is #CO81982.
Finally, Michael, BE SURE to take that Indus GT off of the
CO17945 compatible devices.

5044. complete ATR 8000 system for sale

Newsgroup: comp.sys.atari.8bit
Date: 1994-09-03 03:47:38 UTC
From: ccastn1@phantom.oit.gatech.edu
Message-ID: <348rkq$fu3@phantom.oit.gatech.edu>
Source record: 98517

I have the following complete ATR 8000 system for sale, all for $250 plus shipping. (I will not sell individual parts, because I have no need for a partial system.) Reply by e-mail to ccastn1@oit.gatech.edu.

- Atari 8-bit (choice of 800, 800XL, or 130XE)
- Atari 1050 with US Doubler
- Atari XEP-80
- ATR8000 w/64K
- 5.25" and 3.5" high-density drives, in case with power supply
- all cables, most manuals, lots of software

(I will sell the other two 8-bits for $40 each or $70 for both, plus shipping.)

From: jharris@cup.portal.com
Message-ID: <121530@cup.portal.com>
Source record: 98520

Until Jeff mentioned 'Cosmic Elf', I had no recollection of the 1802. Now I remember. Stirred up lots of old memories.

I almost did the 'Elf'. Almost a 6800. Almost an IMSAI. (Actually wrote my first ML program on one of those, composed and typed in on those front panel switches without anything on paper. That was pretty wild looking back on it). Then decided to get a PET, although when I went into the store they had an Atari 800 sitting there that just arrived that day. I think I made the right choice. :-)

>
>Wonder what he added?

He added a 1/2 color clock delay circuit. Owners of multiple Atari machines may remember than the artifacted colors changed from the CTIA to the GTIA chips, and later changed back to the original setting. Somewhere in GTIA, a 1/2 color clock delay came up, which Atari eventually fixed.

Anyway, the Apple II had the ability to program this delay on a byte by byte basis, by using the top bit of each byte. Thus, a byte only has 7 bits of actual screen pixel data, (making the whole screen 280 pixels), and one bit that determines which set of colors to use. An interesting side effect, is that the delay effects white pixels too of course, shifting them over slightly. You could actally alternate white pixels when doing diagonal lines, making an apparent smoother resolution. Having to adjust a byte at a time limited its usefulness though, and not too many people took advantage of it. You also couldn't have any colored pixels in the area, because the colors would be getting swapped.

>3.2 works with it. I guess it (SD and Ramrod) the SD bank switches to
>the RAM under the ROM and the omnimon in OSNXL is in ROM. Babble.

Yeah, I figured it might be a bank switching problemn (I have an AXLON board
also,) so I told Sparta to use BANKED memory in the CONFIG.SYS, no dice.
Since the Integrater intercepts disk I/O at the SIO level I can only assume
that SDX does not use SIO for disk R/W's. Can anyone verify this?

Source record: 98523

A while back someone mentioned looking
for a program to format Ultra Speed disks.
I have a couple of programs but they were kind
of long.

This program will allow you to format an
Ultra Speed Disk. It only does a physical
format of the disk, it does not write any info
to the disk. With MyDos, you can write this
information by appending a /N after the drive
number in the format function.

I think that the 6507 in the 2600 runs also at 1.79mhz. The reason being
is that the 7800 uses an XL/XE CPU at 1.79mhz. In order to "emuate" the
6507 and use the built-in TIA/RIOT for 2600 mode, either you'd need to
switch crystals or they both run at the same clock. I seriously doubt
that there is a separate crystal to slow it by a fraction of a mhz.

: Ben Corr (BJCORR@Delphi.com)

Sparta screws with things, yes. That is how it allows you to switch
drive assignments. A useful, but redundant feature for BB/MIO users.

With Sparta diskbased the high speed SIO can be removed to make it MUX
compatible. With SDX no software patch will provide this, it needs to be
revised. A MUXable SDX (which FTE supposedly will have sooner or later)
might work with your unit.

5053. Re: UltraSpeed Format

Formatting an US disk is only half of it. There is a software patch to allow MYDOS and AtariDOS to recognize it I believe. If there isn't there is always the Black Box or the US+ OS which impose high speed on any DOS via the hardware which is really cool. I use 1.44 megabyte high speed PBI floppies on MYDOS which are even beyond ultra speed in throughput of course...

>mounts drives all on one common device. It would be a major undertaking...

It would take some work in the kernel (which would replace the
essentials of the Atari OS), but I think it could be done.

The bigger problem would be software. None of our Atari software
would run, and most Unix software would probaly be too slow or want too
much memory.

Basically it would be something to say "see, we can do that", but it
probably wouldn't be very useful. Kinda like all those graphics demos
floating around.

I would be really impressed if somebody did it.

Agreed, though the main problem would be memory management. Unix
assumes separate address spaces for each process. You would probably
need to use a 130XE or such and bank-select to swap processes in and
out. You could use disk to swap out processes when you run out of
memory. Each process would be 16, 32, or 48K in size, with the OS
using 16K, possibly 32K with its own bank selecting.

For a compiler, I would suggest trying to use GCC as a cross-compiler,
though I'm not sure if GCC could deal with the 8-bit architecture.

We would never be able to get a secure system, since there's no way to
stop a process from modifying the OS registers and such.

You would want a load-Atari-OS-and-halt command--probably the most
useful one you could write.

>>Not only that, the custom disk format of Unix would wreak havok with

>>8-bits. Unix mounts drives all on one common device. It would be a
>>major undertaking...

>It would take some work in the kernel (which would replace the
>essentials of the Atari OS), but I think it could be done.

I would tend to be even more optimistic here. Accessing the disk
drives would likely be less complicated than with the Atari OS. It
would require re-writing some of the driver code, but it would likely
be quite stable.

I just recently got a P:R: Connection, and I have it hooked into my Epson RX-80F/T. For some odd reason it will print on only one line. I tried it with Print Shop, and the printer was receiving line feeds just fine. But when I print regular text, it won't get line feeds and will only print on one line. What am I doing wrong?

5058. Re: Unix on 6502? (From hp48 newsgroup)

Newsgroup: comp.sys.atari.8bit
Date: 1994-09-03 20:52:52 UTC
From: krishna@max.tiac.net
Message-ID: <34ann4$gj6@sundog.tiac.net>
Source record: 98531

Another thing about Unix and earlier CPUs is that they probably have a different archetecture which is better suited to multitasking than the 6502. The 6809 for instance definitely has traits which make it easier to multitask with. The 65816 (even in 802 emulation) would be able to do it I'm pretty sure, but not the 6502. When unix was running in 64K archetectures in the early days I bet the machines they used were much different from the 6502 and perhaps more like the 6809.

5059. Re: 65816 /32 info

Newsgroup: comp.sys.atari.8bit
Date: 1994-09-03 23:27:48 UTC
From: Lonnie McClure <lmcclure@delphi.com>
Message-ID: <ZywwOzM.lmcclure@delphi.com>
Source record: 98532

In a message dated 8-30-94, BRYEDEWAARD@DELPHI.COM said:

"The 6502 only uses a byte for opcode. The individual bits
all mean something and the combinations of them make up
the logical instructions. This means the instructions are
not "interpreted" but rather trigger direct microcode sequences."

Unless I am very seriously mistaken, microcode is not involved in the
6502 at all. Rather, like many of its early 8-bit brethren (such as
the 6809), its instructions are "hardwired", which also partially
explains their high cycle speed and relatively small instruction sets.

: Jview seems to choke (loads in only left 1/2 of screen) when I try
: to load in the GIF as-is... :(
: This is a job for a PC.. anyone?

I do know that GIFs that are like 1200x400 or some extra wide format will work with Jview, but it will only load half the screen (the left I think) and then you have to manually slide the zoom over. Sometimes you can't slide all the way you want in one pass. I had a few pics like this. If it looks like Jview is choking see if the zoom window will move.

5061. Q: Seagate 157N 48M HD geometry? ICD MIO?

Newsgroup: comp.sys.atari.8bit
Date: 1994-09-04 01:02:35 UTC
From: Chris_F_Chiesa@cup.portal.com
Message-ID: <121626@cup.portal.com>
Source record: 98536
Cross-posted to: comp.periphs.scsi,comp.sys.atari.8bit

Hello all. I'm posting this for a friend of mine who doesn't have Internet access; I _do_ regularly read comp.sys.atari.8bit but _not_ comp.periphs.scsi, so if you're reading this in the latter would you please email me even if you also post here? I'll return the favor by emailing YOU if you ever pop up with that request in any group _I_ frequent. Thanks in advance.

My friend's question(s):

He has just acquired a Seagate 48meg hard drive, model 157N he tells me, and wants to connect it to a "Multi-I/O" (aka "MIO") unit (an Atari 8-bit device controller, familiar to the c.s.a.8 folks if not the c.p.s. people). The device has the usual line of pinholes for termination resistor packs, but does NOT have the resistor packs themselves; I assume these are needed, as this is his first and only SCSI disk drive so far. Am I correct in this assumption, or can someone with more info about the MIO say otherwise? (My friend doesn't have MIO docs, incidentally; can he get them from Fine-Tooned Engineering now, or anywhere else?)

More importantly, the MIO's "drive configuration" display asks for drive information such as "# cylinders," "# heads," start and end sectors (for partitioning, I presume). We don't KNOW how many cylinders, heads, and (therefore) sectors are on this drive; can YOU tell us?

And finally, the MIO's configuration display asks for an "ID,LUN" which is a pair of numbers (looks like small integers). Can someone please tell us what these numbers should be? (I expect one of them will be the drive's SCSI ID; anybody know how to read the jumper pack on the drive? There's one jumper present so I am assuming it's set for "ID 1.")

Thanks in advance for any light anyone can shed; my friend thanks you also.

Glub...glub...glub...
Ok, here's what my dimwitted memory tells me about memory fetches and
instruction execution on the 6502 and all the rest. :)
6502 - fetches 1 byte per cycle, max fetch of 3 bytes to perform an
instruction from start to finish. (er...bad editor - it takes at MOST
3 bytes to get the entire instruction into the CPU.)
68000/80x86 - reads in 4 bytes for all instructions (I think it is 4)

Ok...don't know about the 68000/80x86, but the 6502 starts executing each
instruction as soon as it has the OPCODE-instruction fetched.
The OPCODE-instruction determines whether more bytes are fetched.
The net effect is that the 6502 can do full instructions in 1 cycle, whereas
the other chips do it in a minimum of 4 cycles (1 cycle per byte fetched).
For 'speed' comparisons I've always used 4 (80x86) = 2 (68xxx) = 1 (6502)
instructions.
NOTE: Whenever the 6502 instruction takes more than 1 cycle per byte fetched
it is because it is writing bytes to memory. Any good book on the 6502
will list the cycles required for each instruction along with notes indicatin
that 'branches take 1 extra cycle when the branch is taken', etc.

Charles Hughes
(hope that helps :)

Same solution as for remote. This was a known bug apparently and the latest release of sio2pc on atari.archive.umich.edu refers to this problem being fixed I believe.

5068. Can sio2pc be multitasked?

Newsgroup: comp.sys.atari.8bit
Date: 1994-09-04 22:31:24 UTC
From: bruck@brachot.jct.ac.il
Message-ID: <9409042230.AA00358@brachot.jct.ac.il>
Source record: 98498

Since I'm gonna buy a video-card for my PC (which will also be my Atari's
disk drive), I have two options:
A) External box, totally independent of PC. Takes control of SVGA monitor.
PC can be doing something else in the meantime, a button switches between
watching TV / PC. Cost of box: $300.
B) Interal card. Requires software to run, and takes total control of PC.
Doesn't need Windows to run.
Better quality of TV picture - I *THINK*. Cost: $200.

My question is this: If I take the B choice (cheaper), will I be able to
multitask the TV driver software, AND the Sio2pc software, to run
simultaneously -- even though they may both require precise timing?

This is important for me.. $100 is alot of money!

Thanks for any suggestions!

From: crow@coos.dartmouth.edu
Message-ID: <34e5oa$n57@dartvax.dartmouth.edu>
Source record: 98568

In <9409042230.AA00358@brachot.jct.ac.il> bruck@brachot.jct.ac.il (Elad Bruck) writes:

>My question is this: If I take the B choice (cheaper), will I be able to
>multitask the TV driver software, AND the Sio2pc software, to run
>simultaneously -- even though they may both require precise timing?

I take it you have SIO2PC now? If so, see how well it runs under
Windows, especially with some other CPU-intensive stuff running. My
experience has been that my 386-20 starts getting problems if I run
SIO2PC under Windows. If you have a 386-40 or 486, you probably will
be OK. With a 286 or 8088, you would certainly want to avoid
multitasking SIO2PC.

The best thing, though, is to experiment. One simple thing to do is
to write a short BASIC, C, or shell program that is simply an endless
loop. Then run SIO2PC and your test program as separate DOS
applications under Windows. If SIO2PC works, then buy the cheaper
monitor.

5074. Re: 65816 /32 info

Newsgroup: comp.sys.atari.8bit
Date: 1994-09-05 04:28:34 UTC
From: jharris@cup.portal.com
Message-ID: <121713@cup.portal.com>
Source record: 98541

This message was EMailed to me with the intent that I forward it to the appropriate newsgroup. Actually, my newsreader limits me to replies to existing messages, so I wasn't able to post this to the topic it belonged in. I waited a few days to see if other messages would pop up, (so I could reply), but don't want to delay this any longer.

The topic was about installing a PAL ANTIC chip, and I had replied that there were several other changes required to make a PAL conversion. Apparently, a partial solution can be obtained with just the ANTIC substitution, so here is the intended message:

==========

From: Masstorage@closer.brisnet.org.au (Masstorage)

That is true IF you want a full pal machine. I have done it myself. Change antic, gtia. Add a 74LS74 plus some componets around it, Change the main crystal to the slighty slower PAL one and add the colour crystal.

The main reason i said the ANTIC mod is so all NTSC machines can see the written-for-PAL demos without doing major changes like above. I have ran a PAL machine with an NTSC antic for a while. It ran fine. I also ran a NTSC gtia with a PAL antic. It also ran fine but i only had a B/W display because the tv cannot display NTSC color....

Please repost this to the news group, I cannot post to the group For some unknown reason.

>is that the 7800 uses an XL/XE CPU at 1.79mhz. In order to "emuate" the
>6507 and use the built-in TIA/RIOT for 2600 mode, either you'd need to
>switch crystals or they both run at the same clock. I seriously doubt
>that there is a separate crystal to slow it by a fraction of a mhz.

No. The 2600 6507 runs at 1.19 MHz -- basically what 1/3 the colorburst
works out to. It has to run at that speed, because that's what all the
cycle counting in 2600 programs was based on.

For the 7800 to run 2600 games, it has to be switchable to that clock
speed.

>have speed and space.
>
It shouldn't be too bad. My friend and I did a Unix-ish port to the
Commodore 64 (Hey, it's what we had :-)). We used a cartridge called the
Quick Brown Box to hold the main parts of the program and swapped them in
and out as needed. It didn't multitask but it worked. We called it Matrix.
I've been trying to dig up the disks for a few months. If/when I find them
it shouldn't be too difficult to bring it over to the Atari.

I always wondered about this. My one nagging doubt has been
because 16-bit immediate values are always encoded as 16-bit values, even
if the value is less than 255. The 8086, for example, can sign extend
an 8-bit immediate into a 16-bit register. You pay for it with larger
opcodes, of course, so the simpler 65816 solution might win out.

5078. Re: Power Supplies redux?

Newsgroup: comp.sys.atari.8bit
Date: 1994-09-05 04:51:19 UTC
From: Lonnie McClure <lmcclure@delphi.com>
Message-ID: <B0+TWbf.lmcclure@delphi.com>
Source record: 98564

In a message dated 9-2-94, Russ Gilbert said:

"The Indus is a 33 watt, output 1.95 amp 11.5v DC!
I have no idea how you can come up with a replacement
supply."

Likely the output from +12 volt line of a standard PC power supply
would work. I doubt the voltage variance of less than 4.35% would
cause any problems.

5079. DOS -> Atari

Hello !

Some weeks ago I got from a FTP-Server a programm called "UTIL",for reading
and writing atari disks in a 5 1/4 disk drive of a PC.But there were to much
problems.
Are there any programms that could manage the correct writing and reading of
atari disks on a PC ?

If you can answer the question,please post here or better you send me an email.

Thank you for your help,

BYE

Welcome to the comp.sys.atari.8bit/Info-Atari8 Digest/INFO-A8 discussion group!

Atari 8-Bit Computers

Vendors and Developers List

Revised 2-Sep-94

Additions/suggestions/comments/corrections having to do with this
Vendor/Developer List are requested. Please send to:

Michael D. Current
mailto:mcurrent@carleton.edu
UUCP: ...!umn-cs!ccnfld!mcurrent
Cleveland Free-Net: aa700

Where to get the latest copy of the Atari 8-Bit Computers
Vendors and Developers List:

ftp://rtfm.mit.edu/pub/usenet-by-group/news.answers/atari-8-bit/vendev
(and many other FTP sites that archive Usenet FAQ Lists)
http://www.cis.ohio-state.edu/hypertext/faq/usenet/atari-8-bit/vendev/faq.html
news:comp.sys.atari.8bit, news:comp.answers, news:news.answers

or, send a message to mailto:mail-server@rtfm.mit.edu that says:

send usenet/news.answers/atari-8-bit/vendev
quit

Finally, you can always ask me for a copy at mailto:mcurrent@carleton.edu

================================================================

"All" commercial vendors and developers should be listed here. "Major"
shareware developers are also listed.

8-bit Atari magazines, both print and disk, are covered in the 8-Bit Atari
FAQ List, available separately.

GEnie, Delphi and CompuServe addresses can be accessed via the Internet:
Genie users are Genie.name@genie.geis.com
CIS users are #####.####@compuserve.com
Delphi users are delphiname@delphi.com
```

Telephone number coversion table:
2=ABC 3=DEF 4=GHI 5=JKL 6=MNO 7=PRS 8=TUV 9=WXY

When writing to request catalogs, it's always a good idea to include a Self-Addressed Stamped Envelope.

When writing to foreign firms, try enclosing a couple of International Reply Coupons (IRC's) as well.

Special thanks to Dave Paterson, GEn: D.PATERSON2, for his efforts at confirming the entire contents of this list in 1994!

==========

5081. Re: DOS -> Atari

Newsgroup: comp.sys.atari.8bit
Date: 1994-09-05 08:10:50 UTC
From: ah818@freenet.buffalo.edu
Message-ID: <CvnDE3.99C@freenet.buffalo.edu>
Source record: 98545

Since I.□m in the same boat you are, I'll respond here with what
I've found out: and hopefully someone wiser will educate both of us.

Almost all the utilities that I've found to write Atari disks on the
PC require that yout Atari drive be double density. The 1050 drive is
NOT double density, but rather some unique species called enhanced
density or whatever.

Util, from what I've read posted here and there, will only work on
a real 360kb floppy disk drive. NOT a highh denisty floppy disk
drive. There are 3 different versions of the UTIL program on
the UMich archive. The only one I could get to work on the format-
ting of an Atari disk on the 360kb IBM drive was the earliest version.
They're all under different names also. The latest is called myutil.zip.
The prior version is filed under ataridsk.arc, and the earliest version
is under pcxfer.arc. If I recall, they were all in different directories
also. So you'll have to look throughj the stuff. Probabbly the Utilities
and the Diskutils directories.

There is a demo program there called Mule that you can look at that can
write to an Atari dsik that can then be read by a 1050 drive, but not
directly. Its pretty limited.

Since my need to transfer files is limietd I think I'll opt out for the
joystick transfer described by Rick Cortese of california. Limited to
30kb files, but a real easy cable hack. I found his file on a local
bulletin board. No direct way to reach him. Left an address of 20802
Laurel Roaf, Los Gatos, Ca 95030 in the description file, but its a 1991
address. The instructions show pinouts and you can cobble the piece to-
gether for next to nothing with spare parts. Oh yea, its also slow.
300 baud as is. Its just a stright dump.

I just want to leran forth on the Atari so I can safely play around
with whatever I want to do with it and not fear messing up critical
stuff on my PC. A nice disk capable transfer would be a dream, but
from reading I get the impression that there can never be any such
compatibility between the Atari 1050 and an IBM floppy drive. Some-
thing to do with the design of the IBM disk controller.

I'd look into SIo2PC if you really need some disk service. It allows
you to use the IBM hard drive as you Atari disk (I understand). The
author offers to put the interface box tofether for you for $50.00,
which includes the costs of the parts and the shareware license. □

Well, if anyone can enlighten us further on this subject it would be
appreciated. Thanks much.

Phillip Fries

(Somebody asks about a program to read/write Atari disks with the IBM.)
'Util' is the best I am aware of for a program to do this with no cables/interface required. The two gentlemen who seem to be having problems with 'Util' might just need a little experimenting and patience. If you just type 'util' at the command line in DOS, you will get the list of commands. A sort of help if you will. It would have been nice if the author would have put a Title, author and version number in that 'help' screen. But I am grateful to him anyway, I use 'Util' all the time. What it boils down to for most purposes are the following two commands.
util /r /b a: (read an Atari disk in drive a:)
util /w /b filename from current directory (write a file from IBM to Atari)
util /l a: gives the directory in A: and is useful just to see if the Atari disk in the drive is reading properly.
Finally the Atari disk MUST be a MYDOS double density disk. Util will not read SpartaDOS or DOS 2.5, etc.
Keep in mind that a single sided double density Atari disk is a 180k disk. Single density and the 'enhanced' 1050 type density will not be readable by 'Util'.
Also, a followup msg. about this mentioned 'high' density. High density is a 1.2 meg 5.25" disk on the IBM. Atari disk drives don't use 'high' density.
Of course the next level up for Atari<->DOS communication is the sio2pc program and cable/interface.

(A little more about 'Util' and Atari->DOS read/writing.)
The person who wants to do Forth work on his Atari:
I don't see much how 'Util' read/writing by IBM will help with doing
Forth on the Atari. Forth generally doesn't use standard filenames,
but has its own unique DOS and 'page' structure. This falls under the
category of Forth disks are not MYDOS disks and 'Util' requires use of
MYDOS disks.

>and writing atari disks in a 5 1/4 disk drive of a PC.But there were to much
>problems.
>Are there any programms that could manage the correct writing and reading of
>atari disks on a PC ?

Yes, there is a better alternative, and everyone here has been talking
about it for quite a long time (only most of the existence of this SIG).
It's called SIO2PC, and it will read/write Atari disks no problem.

Look further, though. The Atari XF551 writes at 360K. And if you have heard of ICD(bought out by Fine Tooned Engineering), they have a US Doubler that will make disks double density. CIS, the company owned by Bob Puff...creator of BobTerm, SuperArc, UnArc, and DisComm...has come out with a modification for the XF551 that will allow you to read/write Atari ST and IBM 3.5" disks, and he has SEVERAL other disk drive and computer modifications available through his company.

: with Print Shop, and the printer was receiving line feeds just fine. But
: when I print regular text, it won't get line feeds and will only print on
: one line. What am I doing wrong?

Check your DIP switches and change the one dealing with LFs and CRs.

: I was thinking that the VCS used a CPU called the 6507. I know that it
: did not have a 6502 (at least the ones I took apart didn't). Wasn't
: it also a 4-bit CPU with like a 1K address space?

The 6507 is to the 6502 what the EC chips are to the standard chips in
the 68K series. In other words, less addressability. I believe it comes
out to 13 bit addressability (8K) but the cart space can only accomodate
4K linearly so for all intents and purposes it is 4K.

: Anyone know who designed it? I've forgotten. Was it Rod Holt?

Same guy as the Atari 8-bit, Jay Miner. How could you not see the
similarities? The PMGs and the 128 color palette and the screen saver
color cycling are the easiest to notice.

Hi.. many of us aren't as familiar with 2600's as we are with 400/800/XL/XE's (which is what this newsgroup is technically about.. even though I guess a 2600 can count as an 8bit Atari) so I suggest you pose this question to either the folks at comp.emulators.misc or one of the .video.games / .video.games.classics newsgroups. They'd (probably) be more help than most of us..

PS- I don't THINK there is one, esp. since I've seen posts asking if one was made and no replies saying "yes", but just "tell me if you find one!" :)

Newsgroup: comp.sys.atari.8bit
Date: 1994-09-05 22:13:28 UTC
From: Russ.Gilbert@apk.wariat.org
Message-ID: <1994Sep05.181155.14306@wariat.UUCP>
Source record: 98556

(Talk about setting Epson printer dip switch for cr/lf.)
Somebody said their p:r: connection worked ok, but Print Shop did not
work ok with the same dip switch setting. The problem is, you didn't
configure Print Shop for the correct printer and run the test.

Source record: 98595

Speaking of term programs... I finally got my first look at ANSIterm and FlickerTerm this weekend. Both are ... interesting. However, my poor ol' buddy who brought them over to my house had a hell of a time demonstrating them to me, because we couldn't get my fairly new ZOOM FAXmodem to perform commands issued at 9600 from the Atari. The same modem works fine with the Atari at 2400, and with my Amiga at 9600, and the Atari at 9600 communicates with the Amiga at 9600 if I use a null-modem cable. So-- all three pieces, in and of themselves, work fine, and two of the three possible pairwise interconnections work fine -- but the third, Atari-to-modem, doesn't -- at 9600. EVERYBODY's happy at 2400. Any thoughts on this from you gurus? Oh, BTW, I'm using an 800XL with an 850 Interface.

RISC evolved due to the advancements in RAM technology which has allowed for faster memory. Also, since RISC tends to result in larger code, I don't think this was the philosophy in the early days when RAM was very expensive. Pre-chip days everything was transistor boards and ferrite cores and all that messy stuff.

5104. Quick MIO Question

(Chris Chiesa talks about using BobTerm a 96 or 14.4 fax modem and an 850.)
I think you've reached the limit of what the 8-bit can do. A while back I posted a msg. about how fast the 8-bit can go. The 850/p:r: can only go reliably at about 4800. With a MIO or BB, you can set your modem for 14.4k but only go about 10k baud. The screen is only about 5k baud, if I remember correctly, faster with Doug Woukon's screen accelerator. BobTerm is the fastest term program I've used, you can set the dce rate at 19.2k baud. I haven't tried Ice-T or Flickerterm. The thing is, I don't think you are going to go faster than about 4800 baud with a p:r: or 850. Also, you are probably using data compression which effectively quadruples text transmission rates. Basically the speed is choking the 8-bit.

I've read 6502 documentation that mentions that it uses a "hybrid design"
which indicates to me that it uses a mix of both hardwiring and microcode.

Cross-posted to: comp.sys.atari.8bit,misc.forsale.computers.other

(This is a re-post, with some items added.)

I have the following complete ATR 8000 system for sale, all for $250 plus shipping. (I will not sell individual parts, because I have no need for a partial system.) Reply by e-mail to ccastn1@oit.gatech.edu.

- Atari 8-bit (choice of 800, 800XL, or 130XE)
- Atari 1050 with US Doubler
- Atari XEP-80
- Atari 830 interface
- Atari 1010 tape drive
- ATR8000 w/64K
- 5.25" and 3.5" high-density drives, in case with power supply
- all cables, power supplies, a joystick, most manuals, lots of software

(I will sell the other two 8-bits for $40 each or $70 for both, plus shipping.)

John D Harris (jharris@cup.portal.com) wrote:

: There have been some comments about RISC, pipelining, and micro-code that
: address the 6502 speed in executing instructions, but so far, no one has
: explained why the memory fetch only takes one cycle. Advanced 68000 CPUs
: have pipelining and streamlined architecture than can execute instructions
: in just one cycle. But they still slow down to that same 4 cycle wait when
: doing a memory fetch. Atari's nifty RISC CPU in the Jaguar has a similarly
: long time to access RAM. So what causes the holdup, and why can a chip as
: old as the 6502 do it in one cycle?

A couple of interesting things to note: I have been working a lot with the
TI DSP chips (they sell a neat "starter kit" with a CPU w/on chip RAM and
a 14 bit A/D and D/A converter with an assembler and debugger that runs on
a PC clone for $99- the whole thing is about the size of a small index card
and connects up via RS232) and they fetch from memory in one cycle- I
think. Maybe it's two. I do know from having played with a fancy logic
analyzer that when you do consecutive reads and writes to external memory,
it doesn't even bother "deselecting" external memory. So the line just
goes high and stays high until the write is done. Pretty slick. (This was
from running a memory test program on some external memory). Also, I have
heard that the Rockwell DSP chips are extremely similar to the 6502...
which makes sense. A 6502 with a one-cycle multiply-add and loop (which is
what DSP chips are basically designed to do- this is for digital filters
and FFTs but also does vector dot products and matrix multiplication FAST)
running at 20 Mhz would be a pretty decent DSP. Well, it would have to
have sixteen bit registers too, but you get the idea.

I'm using a P:R: Connection with AnsiTerm and FlickerTerm and they won't work with any modem higher than 1200baud for some reason. Also, I don't really like the way that FlickerTerm works...you practically have to be an expert programmer to use it, since most of the commands require shift+control codes that usually end up doing something to whatever you're doing on-line. Not good...

: Basically the speed is choking the 8-bit.

I don't think the screen speed is the problem. Tom Hunt recently said he wrote a custom screen handler that will go way way fast, like 50K baud or something.

Even considering the FlickerTerm or Bobterm overhead, I think you have more than enough scrolling speed to support 19.2K fully or even beyond. With bold enabled FlickerTerm drops down to 1024CPS but that's about the only logjam. The throughput is going to be as good as your interface in the end. Bob Puff would not have considered faster speed settings for Bobterm for his R:P: interface if he didn't think it would handle it.

The fact is that the P:R: and 850 BARELY do 9600 on a GOOD day. Not all can do it. But that's not the 8-bit's fault. If you guys want a better cheap interface, call up Puff. For some reason he sees "lack of interest" in the R:P: interface !!!

5117. My ATARI was arrived yesterday!!

Newsgroup: comp.sys.atari.8bit
Date: 1994-09-07 00:51:13 UTC
From: odaman@rocky.unoke.pfu.fujitsu.co.jp
Message-ID: <9409070046.AA01255@rocky.unoke.pfu.fujitsu.co.jp>
Source record: 98598

Hi, all!!

My Atari130xe was arrived yesterday!! I was waiting about one
month!!
But unfortunately, he didn7t bundle manuals and disks. So I don't
know its usage.

HELP!! CAN I MAKE BOOTABLE FLOPPY DISKS?? I HAVE NO OS NOW.
If I can't, can someone send bootable OS disks to me??

When I power on Atari, there is many message "BOOT ERROR". If disk
drive is powered off, there is no message and I can play in BASIC.

Please HELP. Thanks!!

Atari130xe is very small. I didn't think Atari is a such a small
machine. :)

>For 'speed' comparisons I've always used 4 (80x86) = 2 (68xxx) = 1 (6502)
>instructions.

But the 6502 has to take time to determine how many bytes to read
before doing anything; if you always know your instructions are 4
bytes long, you save time by not checking for the instruction length
each time. (On an 8-bit machine, 2 bytes would probably be used.)
I don't think there are many new chips being designed to use
variable-length instructions.

>NOTE: Whenever the 6502 instruction takes more than 1 cycle per byte fetched
>it is because it is writing bytes to memory. Any good book on the 6502
>will list the cycles required for each instruction along with notes indicatin
>that 'branches take 1 extra cycle when the branch is taken', etc.

I was about to say that I thought even a NOP took 2 cycles, but I
might be thinking of the 6809, and I can't find anything in my Atari
books about instruction cycles.....
(Does anyone have a listing of them?)

Welcome to the comp.sys.atari.8bit/Info-Atari8 Digest/INFO-A8 discussion group!

Atari 8-Bit Computers

Vendors and Developers List

Revised 2-Sep-94

Additions/suggestions/comments/corrections having to do with this
Vendor/Developer List are requested. Please send to:

Michael D. Current
mailto:mcurrent@carleton.edu
UUCP: ...!umn-cs!ccnfld!mcurrent
Cleveland Free-Net: aa700

Where to get the latest copy of the Atari 8-Bit Computers
Vendors and Developers List:

ftp://rtfm.mit.edu/pub/usenet-by-group/news.answers/atari-8-bit/vendev
(and many other FTP sites that archive Usenet FAQ Lists)
http://www.cis.ohio-state.edu/hypertext/faq/usenet/atari-8-bit/vendev/faq.html
news:comp.sys.atari.8bit, news:comp.answers, news:news.answers

or, send a message to mailto:mail-server@rtfm.mit.edu that says:

send usenet/news.answers/atari-8-bit/vendev
quit

Finally, you can always ask me for a copy at mailto:mcurrent@carleton.edu

================================================================

"All" commercial vendors and developers should be listed here. "Major"
shareware developers are also listed.

8-bit Atari magazines, both print and disk, are covered in the 8-Bit Atari
FAQ List, available separately.

GEnie, Delphi and CompuServe addresses can be accessed via the Internet:
Genie users are Genie.name@genie.geis.com
CIS users are #####.####@compuserve.com
Delphi users are delphiname@delphi.com
```

Telephone number coversion table:
2=ABC 3=DEF 4=GHI 5=JKL 6=MNO 7=PRS 8=TUV 9=WXY

When writing to request catalogs, it's always a good idea to include a Self-Addressed Stamped Envelope.

When writing to foreign firms, try enclosing a couple of International Reply Coupons (IRC's) as well.

Special thanks to Dave Paterson, GEn: D.PATERSON2, for his efforts at confirming the entire contents of this list in 1994!

: really like the way that FlickerTerm works...you practically have to be an
: expert programmer to use it, since most of the commands require
: shift+control codes that usually end up doing something to whatever you're
: doing on-line. Not good...

FlickerTerm copies most of the hotkeys from Bobterm and Kermit. Those familiar with both would feel right at home with FlickerTerm. If you don't lke shift+control hotkeys you must not like Bobterm therefore you are definitely in the minority!

I usually change term settings in the term menu (option T) so I can see the flags (like bold/blink on off). The option H help menu gives you online help, what could be easier? It's unavoidable to have funky hotkeys with a keyboard with so few keys.

FlickerTerm's support of VT100 is EXTENSIVE. The numeric keypad, arrow keys, even the freaking VT100 LEDs. Bold and blink, backquote, tilde, etc... CR vs. CR/LF settings IN/out, true vs. simulated tab, null and bell generation (which is really never used), brackets, control ^, \, _ support (some editors take those), and on and on. We kept on suggesting things to Clay to add to the VT100 support to get to this point. It's really fully featured.

The only 2 things it needs is a hardware flow control toggle for Black Box users and a reoganization of IBMASCII translation towards more of what PabQwk supports (the common vs. the uncommonly used ones).

I don't know why Flick won't go over 1200 baud for you as long as you have a fast enough modem and your dialup is 2400 or above. I dial in and connect at 19.2 with my Hayes Accura 144 and Black Box interface no problem.

(Rob Funk asks if anybody has a list of 6502 instruction cycles.)
Don't you just love these engineering stuff? I really like it. It's
over my head like the book I have and may try to actually read one day
which also contains a table of 6502 instruction cycles.
'6502 Assembly Language Programming' by Lance Leventhal Osbourne, 1979.
ISBN 0-931988-27-6.
I do use the book for the instruction set explanations when I'm a bit
confused about what an instruction does.
The NOP takes 2 clock cycles.
Now, if I had a scanner, maybe I could enter the table and post it some
place.

Hi, all.

Are there some free document of ATARI-BASIC??
I want command reference guide like document. It is very hard to
get books from USA/Euro. for Japanese, so I want free ducument.

If someone has nice one, please mail it to me.

Thanks!!

OtA, check out my Atari Newbie / Stupid Questions / Emulator Help FAQ for information on some of the simpler stuff on BASIC. From there, >I< don't know of any good free electronic-media BASIC tutorials, but I'm sure just being patient and asking questions on the net could help at least a little.
:)
I'll e-mail the FAQ as well as post it here and on comp.emulators.misc!

Have fun!

By Bill Kendrick
Revision 0.4 !! PLEASE !!
September 7, 1994 ASK MORE QUESTIONS

Differences from Rev.0.3: Added info on DCM2DSK.
PLEASE also refer to: MyDOS 4.5 documents, SIO2PC documents,
XF2 documents, and the Atari 8-bit F.A.Q.

For general help (hardware, magazines, etc.) please check the Official
Atari 8-bit FAQ file:
From: Michael Current <MCURRENT@carleton.edu>
Where to get the latest copy of the Atari 8-Bit Computers
Frequently Asked Questions List:

ftp://rtfm.mit.edu/pub/usenet-by-group/news.answers/atari-8-bit/faq
(and many other FTP sites that archive Usenet FAQ Lists)
http://www.cis.ohio-state.edu/hypertext/faq/usenet/atari-8-bit/faq/faq.html
news:comp.sys.atari.8bit, news:comp.answers, news:news.answers

or, send a message to mailto::mail-server@rtfm.mit.edu that says:

send usenet/news.answers/atari-8-bit/faq
quit

Finally, you can always ask Michael for a copy at
mailto::mcurrent@carleton.edu

Objective of this file:
Much discussion has gone on in the comp.sys.atari.8bit Usenet
newsgroup about the newly released (mid 1994) Atari 8bit emulator for
IBM / MSDOS based computers, the PC X-Former 2.0 (XF2 for short). Many
people in the 8-bit community have gotten, well, fed up with the XF2-based
questions which do not pertain to them, or to the really dumb questions
which are in fact understandable to new or rusty Atari 8-bit users, but
have just gotten on the nerves of some of the comp.sys.atari.8bit
readers/digest subscribers.
This file was created to reduce the number of 'newbie' and XF2
questions.
This FAQ will present answers to simple questions like "how do I turn
```

off BASIC" (a good answer to that of course is, READ THE FRIGGIN' MANUAL)
and "how do I get a disk directory?" (which is less obvious on
Atari 8-bits, err.. MOST 8-bits <grin>).
It will also direct people who are unaware of the large amount of Atari
8-bit support (NOT NECESSARILY EMULATOR SUPPORT) and perhaps become a
suplement for the many official and unofficial files floating around the
net (like the official FAQ, the Vendor/Developer List, the Who's Who list,
etc.).

---=== XF2 Questions: ===---

Q.1) What does "READY" mean?
A.1) This is the Atari BASIC prompt. See below for hints on Atari BASIC.

Q.2) Why doesn't this program load?
A.2.1) The program may not work under the Atari 800 Operating System, it may
require the XL/XE Operating System (which XF2 does not emulate).
A.2.2) Be sure you turned BASIC off before trying to load it if it cannot
run with BASIC on.
A.2.3) It may just refuse to run on the XF2 emulator.

Q.3) How do I turn off BASIC?
A.3) To toggle BASIC on and off, press [SHIFT]-[F10] ([F10] is [RESET], note:
on a real Atari 8-bit, [SHIFT]-[RESET] does not have this effect).

Q.4) Why doesn't this game/program run correctly?
A.4.1) It may use player/missle collision detection which is not supported
on the XF2.
A.4.2) (See Question 2).

Q.5) How do I exit XF2 and return to DOS?
A.5) Press [F5]. Note: this does NOT temporarily 'shell' or 'jump' to MSDOS.

Q.6) How do I get to Atari DOS?
A.6.1) In BASIC, type "DOS" at the "READY" prompt.
A.6.2) Reboot without BASIC on.
A.6.3) Be sure you have a DOS-bootable disk image as the first MSDOS
parameter after the "XF2" command. (DOS25.XFD and MYDOS45.ATR are
both DOS boot-disk-images and are both in the XF2.ZIP file).

Q.7) How do I use MSDOS files with XF2?
A.7.1) Add the files to the command line and use them as their respective
drives (be sure the first drive is a DOS-bootable disk image).
Example: XF2 MYDOS45.ATR filename.ext
When booted the Atari will have two drives, D1: will be the MyDOS
4.50 disk image and D2: will be a write-protected disk which contains
only the file "filename.ext". Note: there are bugs in XF2 which
make accessing files from different directories a bit hard, just use
the MOVE (or COPY and DEL) commands in MSDOS to get the file to the
directory where you call XF2 from.
A.7.2) Use the MSDOS program S2PC (S2PC.ARC available in the Utilities
directory at the UMICH archives) which allows you to access files
within a MyDOS/compatible .ATR disk image without using an SIO2PC

or the XF2. S2PC let's you read, write, delete, change directory,
and view the directory of a MyDOS/compatible .ATR disk image. It
can be used via command-line parameters from MSDOS, or as a menu.

Q.8) Just what ARE .ATR and .XFD files?
A.8.1) Refer to the XF2 and SIO2PC manuals for details on these files.
A.8.2) Simply put, they are Atari disks, stored as files which are as big
as the disk they represent (an 88k disk image will use 88k on the
IBM). .ATR files are used by SIO2PC (see below) as well as the XF2
(and the S2PC program mentioned above). .XFD files are used by
ST X-Former (the Atari 8-bit emulator for Atari ST's) and
PC X-Former (XF2).

Q.9) What's SIO2PC?
A.9.1) Refer to the XF2 and SIO2PC manuals for details on this program.
A.9.2) This is a program which runs on IBM/compatibles which, with the use
of a simple (and relatively inexpensive) cable, makes the IBM act
as though it were an Atari disk drive. (Up to four drives, actually).
It uses disk image files (.ATR's) and can also let the Atari access
single IBM files (much like XF2 does) as a single file all alone in
its own disk. It also currently allows Print-Thru (all access to the
Atari "P:" (printer) device can be redirected to the IBM's printer,
screen, or MSDOS file; different translations/conversions are
user-defined when the Print-Thru mode is turned on). Finally, with
the use of two programs on the Atari 8-bit (the only two programs
that currently have anything to do with SIO2PC that have been written
(to my knowledge) for the Atari 8-bit), the IBM can be controlled
remotely (commands are sent from the Atari, typing on the IBM is not
necessary) and files can be sent directly to the IBM's drives.

Note: The following sections will simply discuss Atari BASIC, the Atari OS,
and Atari DOS 2.5 and MyDOS 4.50 (because these topics seem the most
relevant to the less-knowledged/experienced XF2 users).

---=== Getting around on the Atari: DOS and OS ===---
I. AtariDOS and MyDOS QuickReference:

MyDOS presents the user with the following commands:

[*] Disk directory of current directory (like "dir *.*" in MSDOS)
[1]-[9] Disk directory of a disk drive (like "dir a:*.*" - "dir i:*.*")
[A] Disk directory (like "dir <mask>" and optional output destination)
[B] Quit to cartridge
[C] Copy file(s) ("<source>,<destination>" copies from one place or
disk to another, just "<source>" copies from one place on one disk
in a drive to the same place on another disk in the same drive
(asks for swapping))
[D] Delete file(s) (add "/N" to delete without being prompted first)
(add ">*.*" or ":*.*" after a subdirectory name to delete the
files within it. A subdirectory name alone will delete the
subdirectory (if it is empty and unlocked)). (Acts like both
"del" and "rd" in MSDOS.)

[E] Rename file(s) (renaming multiple files is allowed, but be careful).
(like "ren <old> <new>" in MSDOS - with MyDOS, use "," between
old and new masks.)
[F] Locks file(s) from overwrite, deletion and appending (like
"attrib +r <mask>" in MSDOS.)
[G] Unlocks file(s) (returns them to their default state).
[H] Writes DOS files to a disk (this creates a disk which boots with
the current version of MyDOS you are using and also has the menu
file "DUP.SYS" on it as well). (This is like "sys"(?) in MSDOS.)
[I] Formats a disk (add "/N" after the drive number to do a quick-format
of an already-formatted disk (ie, just a very fast delete "*.*").
[J] Duplicate disk (copies an entire disk, including boot sector,
when using XF2, it's much quicker to just copy one .XFD or .ATR to
another).
[K]
[L] Load binary file: loads a compiled program. (like "<filename>" in
MSDOS, except any ".EXE", ".COM", ".OBJ", etc. is still required.)
[M] Run at address. Mainly for advanced users. Reboot is "E477",
reset is "E474" (these are the hex values of the addresses where
the routines to reboot and reset are.)
[N] MEM.SAV: when this is on, whenever you go to DOS (from BASIC,
for example) it will write what is in memory to a file "MEM.SAV"
so that when DUP.SYS (the menu) loads it isn't lost forever.
When you exit DUP.SYS with the "B: Run Cartridge" command, MEM.SAV
is reloaded and the environment should be as it was when you left.
It's probably quicker to simply "SAVE" your programs (if in a
language) which aren't nearly as big as all of the memory that
MEM.SAV saves.
[O] Options: this presents the user with some options. Mainly for
advanced users or special setups. See the MyDOS docs for details.
[P] Set density. Forces a drive to be recognized at a certain density
if MyDOS can't figure it out. (??)
[Q] Make a subdirectory. (like "md" or "mkdir" in MSDOS).
[R] Set default directory. (like "cd" in MSDOS and "cwd" in SpartaDOS)
This makes "D:" now the same as a subdirectory or other drive.
ie, "D2:" will make all calls to "D:" act as though they are to
"D2:" instead. Some programs when prompting for filenames do not
add "D:" to the beginning if one is not present, they add "D1:".
If you don't trust a program to look to "D:" instead of "D1:" and
you want it to look to some place OTHER than "D1:" (ie, where "D:"
is pointing which could be a VERY long path list), just add "D:"
to the beginning. ALSO, some programs don't even ADD "D:"'s if they
aren't in the filenames you give and may give errors (138, for
example: device not present, ie, if you said "TESTFILE.DAT" it
may think you want "T:" instead of "D:TESTFILE.DAT").
[S] Set ramdisk number. This is also under [O]ptions.
[V] Verify writes. This is also under [O]ptions. When Verify is on,
writes will be slower but 100% reliable. With it off, writes will
be much faster but possibly not as reliable (on bad disks, for
example). Default is off.

AtariDOS presents the user with the following commands which are identical
to MyDOS's commands: A,B,C(no swaping),D,E,F,G,H,I(some densities),J,K,L,M,N

AtariDOS 2.5 presents the user with the following commands not present or
not the same as MyDOS's commands:
[O] Duplicate file. This is used to copy a file from one disk to another
using only one drive. (In MyDOS, giving just a source will make
[C]opy act like DOS 2's Duplicate.)
[P] Format Single. In DOS 2.5, this is used to format 88k (Single Density)
disks. To format an Enhanced Density (127k) disk, just use [I].
In DOS 2.0, [I] is the only format option and only handles 88k.
(I may be wrong, but I have never had a Double Density drive under
Atari DOS 2.0 or 2.5!)

II. General DOS and OS questions:

Q.1) How do I access the disk drives?
A.1) First, you need to have booted with a DOS. All but one DOS is on
disk (SpartaDOS X is on cartridge). When the Atari boots up, it
does some of its 'boot-up stuff' which includes looking for a
disk drive connected and turned on which is set up as drive #1.
It then begins to load from the disk's "boot sector". If none
exists or there's a nasty error on the disk, you get the
"BOOT ERROR" notice until the error is fixed. (On SpartaDOS disks,
even non-bootable disks have a boot sector, but all the boot
sector is is a small program which displays a 'not a boot disk'
error).
To end the digression, the answer to 'how do I access the disk
drives' starts with 'you must boot the Atari with a DOS'. Check
the 8-bit FAQ and the UMICH and other FTP archives for lists of
DOSes available for Ataris, but the most used are Atari DOS (for
compatibility with almost ALL older software), MyDOS (for an
Atari DOS compatible high-end DOS), and SpartaDOS (for a very
high-end DOS which looks much like MS-DOS but unfortunately
cannont run all software which runs fine with Atari DOS and
MyDOS.) Note: SpartaDOS does NOT run on Atari 400's and 800's
(except the cartridge versions and I believe disk version 1.1).
Now that you have a DOS loaded, the Atari understands the
"D:" device (see below for Atari devices). Since there is more
than one disk drive, you have to be able to tell them apart.
The Atari uses numbers when it has more than one of the same
device, so "D1:" is drive 1, "D2:" is drive 2, "D3:" is drive 3,
etc.!
After the "D:" device name comes the filename. Of the most used
DOSes, only MyDOS supports lowercase letters in filenames, but
since most programs force uppercase entry for filenames, nobody
really seems to use lowercase in their filenames.

Q.2) How do I copy things from one place to another?
A.2) Atari DOS and MyDOS give you the "C" command in their menu
interface. When it asks for a source and destination, you can
use wildcards (* and ? like in most other DOSes) to copy more

than one file at a time. You can also present no destination
so that a file can be copied from one disk in drive 1 to another
disk in drive 1, for example, and the DOS will ask you to insert
each disk.

Q.3) What are subdirectories?
A.3) Subdirectories are places where files go which are just like the
normal directory of a disk, except the they happen to be WITHIN
that normal directory, or even another subdirectory. For example,
you can have your disk divided up into the "GAMES" files, the
"GRAPHICS" files and the "SOUNDS" files. A directory of the disk
(the "root" or "base" or "trunk" directory) will simply list the
three subdirectories, "GAMES", "GRAPHICS" and "SOUNDS". Then,
if you ask for a directory listing of the "GAMES" subdirectory,
you will see the files (and perhaps other subdirectories) within
the "GAMES" directory. Think of it as a tree. For people familiar
with Macintoshes, "Folders" are simply subdirectories. A window
which appears when you open a "Disk" Icon is the "root", and all
of the "Folders" within it have more windows in them which also
have file and folder icons.
Here's a comparison to using subdirectories on different DOSes
root 'GAMES' 'SPACE' within 'GAMES'
AtariDOS D: n/a n/a
MyDOS D: D:GAMES: D:GAMES:SPACE:
SpartaDOS D: D:GAMES> D:GAMES>SPACE>
MSDOS (IBM) \ \GAMES\ \GAMES\SPACE\
Note, only Atari DOS would be using drive 1 here, all other DOSes
are not necessarily using drive 1, and MyDOS and SpartaDOS may
already 'be within' a subdirectory.
In MyDOS and SpartaDOS (and MSDOS), you can change the 'current'
or 'default' directory to a different place (a different drive or
a subdirectory). "D:" can stand for "D1:" (like AtariDOS always
does) or "D2:GAMES:SPACE:"! PLEASE READ THE MYDOS DOCUMENTS FOR
DETAILS ON THIS!

Q.4) What does "P:", "E:", "K:", etc. mean?
A.4) As stated before, the Atari has devices. "D:" is added when a
bootable disk in drive 1 is read. Other exist as well:
C: cassette - readable and writeable, no filenames
D: disk drive - readable, writeable, random access, directory,
files, multiple devices (up to 9 on MyDOS and newer SpartaDOS,
8 on AtariDOS)
E: editior - readable, writeable. This is how input from the
keyboard and output to the screen is normally handled. If
you wish to type a small file up by hand and have it sent to
the printer or a file, use "E:" as the source.
K: keyboard - readable. This is just the keyboard. Input from
it is not 'echoed' back like with the "E:ditor".
P: printer - writeable. Send data to this and it will appear
on the printer. You can print files (documents, etc.) by
using "P:" as the destination. The Atari XL/XE OSes support

"P1:" and "P2:", although I believe this usage is rare.
R: RS232 - readable, writeable, concurrent mode. This is not
built in to the Operating System, but is loaded. It supports
modems. The Atari 850 Interface has it's "R: handler"
'built-in', which means the Atari also looks for an 850 (or
other compatible interface) and receives the "R: handler" code
from it. Other interfaces and the Atari 'direct-connect'
modems require a file to be loaded which contains the "R:"
code. "R1:" and "R2:" is also supported, but also its usage
seems rare.
Z: RTime8 clock - readable, writeable. This is also not built
in to the OS, but loaded. This is loaded from disk and lets
the user access the "RTime8" real time, battery-backed up clock
for the Atari 8-bit. (This is a cartridge-based device).
I am unaware of any "Z:" clone which let's you set the Atari
internal (non-real time, non-battery-backed-up) clock if you
do not have an RTime8, although I'd love to see one! <hint!!>

Q.5) How do I print something from DOS?
A.6) As stated above, just use the "C"opy command, then use the file
you wish to print as the 'source', and "P:" as the 'destination'.
Example: "D1:DOCUMENT.TXT,P:"

---=== Getting around on the Atari: BASIC ===---

Q.1) What does "READY" mean?
A.1) Again, this is simply the prompt that Atari BASIC (and most older
BASIC's) presents the user when it is in "Immediate" mode.
Entering a command will cause it to act immediately.
Entering a line number and then a command will place that line into
the current program.
Entering a line number alone will remove that line from the current
program.
To start a program, use the "RUN" command.
To erase a program, use the "NEW" command.
To clear variables, strings and arrays, use the "CLR" command.
To load a program, use the "LOAD" command followed by a filename
(see below). To load and run a program, use the "RUN" command followed
by a filename.
To save a program, use the "SAVE" command followed by a filename.
To list a program, use the "LIST" command followed by an optional
start and end set of lines seperated by commas.

Q.2) Where can I learn Atari BASIC?
A.2) A (set of) file(s) will be created explaining all of Atari (and Turbo)
BASIC's commands and their usage. (A larger file may be produced
which will be based on examples provided in the Atari BASIC Reference
Manual). (As of today, 7/23/94, these particular files do not exist).

Q.3) How do I quit BASIC?
A.3.1) Type "DOS" to quit BASIC and return to DOS.
A.3.2) Type "BYE" to quit BASIC and exit to the OS's "bye" routines

(Atari Memo Pad on 400/800's, Atari Rainbow on 1200XL's, and
Self Test on other XL's and XE's). (Note: On 1200XL's, use [HELP]
to go to the Self Test when the Atari Rainbow appears).
A.3.3) For XF2 users, remember, [SHIFT]+[F10] reboots and toggles BASIC.

Q.4) Why don't strings work?
A.4) Strings must be "dimensioned" like arrays in Atari BASIC. Strings
are special character arrays. See the BASIC usage/etc. files mentioned
in the answer to question 2. Simply put, to make a string that will
accept up to "#" character, use DIM <name>$(#) . Example:
DIM A$(10) - now A$ can contain between 0 and 10 characters.

Q.5) How do I make graphics?
A.5) Use the "GRAPHICS" command to switch between the following screen modes:
(Note: All modes except 0, 9, 10 and 11 have four lines of 40 x 24 x 2
sized text covering the bottom of the screen. Add "16" to the mode
number to remove this window (but do not make any PRINTs or PUTs to
the standard output otherwise a GRAPHICS 0 screen will appear))
(Note: Add "32" to the mode number to keep the screen from clearing
when it appears. One problem, however, all screens overlay each other
so unless you only use certain modes at certain times, parts of some
screens will become (or start out) with 'garbage' on them.)
0 40 x 24 x 2 text
1 20 x 24 x 5 text
2 20 x 12 x 5 text
3 40 x 24 x 4 graphics
4 80 x 48 x 2 graphics
5 80 x 48 x 4 graphics
6 160 x 96 x 2 graphics
7 160 x 96 x 4 graphics
8 320 x 192 x 4 graphics
9 80 x 192 x 16 luminence-only graphics
10 80 x 192 x 9 graphics
11 80 x 192 x 16 hue-only graphics
12 40 x 24 x 4-colored text
13 40 x 12 x 4-colored text
14 160 x 192 x 2 graphics
15 160 x 192 x 4 graphics
Commands available in Atari BASIC for manipulating simple graphics
include:
PLOT x,y POSITION x,y COLOR c (c=color or character value)
DRAWTO x,y LOCATE x,y,r (where r is where result will be stored)
SETCOLOR c,h,l (c=palette location, h=hue, l=lum)
Colors:
COLOR command colors are not identical to SETCOLOR command colors:
COLOR 0 will draw using the background color, set with
SETCOLOR 4,hue,lum
COLOR 1 will draw using color "0", set with
SETCOLOR 0,hue,lum
COLOR 2 will draw using color "1", set with
SETCOLOR 1,hue,lum

COLOR 3 will draw using color "2", set with
SETCOLOR 2,hue,lum
Except in GRAPHICS mode 10, where COLORs 0, 1, 2, and 3 must be
POKEd into memory locations 704, 705, 706 and 707 (the
player/missle graphics color locations). Examples of this will
be presented in the BASIC usage files. (Sorry)

Q.6) How do I make sound on the Atari
A.6) Remember, XF2 doesn't support sound! But, anyways, in Atari BASIC:
SOUND c,p,d,v
c=channel (0-3)
p=pitch (0-255)
d=distortion (0,2,4,6,8,10,12 or 14)
v=volume (0-15)
The buzzer character is CHR$(253) aka [CONTROL]+[2] (NOT [CONTROL]+[G])

Q.7) How do I move the cursor and edit?
A.7) The Atari "E:" device (standard input/output which is the "editor")
allows the following characters for editing:

Key: AtASCII #: Use:
Atari none Turn inverse on/off (Atari 400/800 kybds)
Inverse [Triangle] none Turn inverse on/off (Atari XL/XE kybds)
CAPS none Turns caps-mode to lowercase (400/800 OS)
CAPS none Toggles caps-mode from upper to lower (XL/XE)
Sh-CAPS none Turns caps-mode to uppercase (all OSes)
Ct-CAPS none Turns caps-mode to [Control]-[Lock] (all)
Up ([^-]) 28 Move cursor up
Down ([^=]) 29 Move cursor down
Left ([^+]) 30 Move cursor left
Right ([^*]) 31 Move cursor right
Space 32 Move cursor right (overwrites w/Space char)
BackSpace 126 Move cursor left (deletes previous char)
Delete ([ShBkspc]) 156 Deletes a (logical) line (1-3 physical lines)
Insert ([Sh>]) 157 Inserts a physical line
Ct-Delete ([^Bksp]) 254 Deletes char under cursor, pulls rest left
Ct-Insert ([^>]) 255 Inserts space under cursor, pushes rest right
ClearScn ([^<]) 125 Clears screen
Bell ([^2]) 253 Sounds buzzer
TAB 127 Moves cursor to next TABstop
ClrTAB ([^TAB]) 158 Clears any TABstop under cursor
SetTAB ([ShTAB]) 159 Sets a TABstop under cursor
ESC 27 Sets ESCape (next edit char after is shown,
not done, non-edit chars shown (like normal))
RETURN 155 Sends End Of Line (moves cursor to lowerleft
of next line, accepts input)
Note: Inverse characters have values of the normal version of the
characters plus 128. (The only non-viewable inverse character is
inverse-ESC, or what would be the [ESC],[RETURN] combination. The
character exists, but must be set into screen RAM by hand. Oh well,
at least you still have 255 easily viewable characters! <grin>)

Q.8) How do I make the editor characters appear
A.8.1) As shown above, you must have an ESC sent before them.
When simply entering text, type [ESC] then the edit key and the
character for that edit key should appear.
When entering text in a PRINT statement, you must have it send an
ESC beforehand, so first type [ESC],[ESC] to make an ESCape character
appear, then type [ESC] then the edit key and the character for that
edit key should appear. When the PRINT statement is executed, the
first ESCape (which you typed as two [ESC]'s) will make the editor
SHOW the following character (even if it is an edit character), then
the character which you entered (with [ESC] and then the edit key)
will make that character appear. This makes it difficult to align
a set of PRINT statements which make a multi-line picture or menu
which uses viewed edit keys. It is probably best to have all of the
lines in your program with the PRINT statements that can fit visible
on the screen, then edit them (without putting any of the ESCape
characters in, then when the picture looks like how you want it on
the screen, move the cursor to on top of each edit-key character and
press [Control]+[>] (Control-Insert). A blank space should appear
under the cursor and the rest of the line should move right. Now,
type [ESC],[ESC] and an ESCape edit-key character should appear
where the blank space was. When you are finished doing that for
each line with those PRINTs in it, BE SURE TO ENTER THEM INTO THE
PROGRAM BY PRESSING [RETURN] ON EACH OF THOSE LINES! Whew!
A.8.2) Set the memory location "766" to "1" with the command "POKE 766,1"
to turn on the no-edit mode (ALL characters except End Of Lines
will appear, even ClearScreens!) When you want to go back into
normal mode, set the location back to "0" with "POKE 766,0".

Q.9) What's with the colors changing?
A.9) THIS, MY FRIEND, IS THE FIRST EVER SCREEN SAVER! This is called
"Attract mode" as was used on the Atari 2600 and Atari 400/800/XL/XE
series (and probably on the 5200 and 7800 but I cannot confirm this).
When a key hasn't been pressed for 7 or 9 (depending on OS, model, etc)
minutes, the screen colors begin changing, thus protecting your TV
or monitor from having a static image burned on it.
To turn this mode off, press a key, or, if within a program, use the
command "POKE 77,0" at least once every few minutes (IF the screen is
active, otherwise turning it off would be kinda useless).
To turn it on, wait 7 or 9 minutes without pressing a key or having
location "77" set to "0", or set location "77" to "128" with
"POKE 77,128", voila! instant attract mode!

Q.10) How do I access 'devices' on the Atari?
A.10) The following commands are available to Atari BASIC's (and also
variations on these are available in most other Atari languages!):
OPEN #a,b,c,d$ Opens channel 'a' for access to 'd$' in mode 'b'
with auxillary mode 'c'. Channel 'a' must be
free or a 'Channel already open' (129) error
occurs. Examples:
OPEN #1,4,0,"K:" - input from keyboard
OPEN #2,8,0,"P:" - output to printer

OPEN #3,12,0,"D:FILE" - random access to disk
OPEN #4,9,0,"D:DATA" - append-output to disk
OPEN #5,13,0,"R:" - concurrent to RS232 (modem)
OPEN #6,6,0,"D:*.TXT" - directory access to disk
(reads directory of "*.TXT" mask)
CLOSE #a Closes channel 'a' (freeing it for use)
GET #a,b Reads a byte from channel 'a' and stores it in 'b'
PUT #a,b Puts byte 'b' onto channel 'a'
INPUT #a,b$ Reads a string (up to 255 bytes and a REQUIRED
'end of line' (character 155)) from channel 'a'
and stores it in 'b$'
INPUT #a,b Reads a string (up to 255 bytes and a REQUIRED
'end of line' (character 155)) from channel 'a'
and stores the numeric value of it in 'b'
PRINT #a,<stuff> Just like the normal BASIC PRINT statement, but
sends the information to channel 'a' (semicolons,
comas, and mixed types are of course allowed).
STATUS #a,b Reads the error 'status' of channel 'a' and stores
it in 'b'
XIO a,#b,c,d,e$ General I/O call. This a little complicated and
may be expanded upon in a future revision. Just be aware of the
following:
a - command
b - channel to use (usually must be free)
c - auxillary mode 1
d - auxillary mode 2
e$ - file or device to act upon
Examples:
XIO 32,#1,0,0,"D:FILE,OLDFILE" - renames file
XIO 33,#1,0,0,"D:OLDFILE" - DELETES file
XIO 34,#1,0,0,"D:GAMES" - creates a directory in My- & Sparta-DOS
XIO 35,#1,0,0,"D:NEWFILE" - locks a file from over-write and
deletion
XIO 36,#1,0,0,"D:NEWFILE" - UNlocks a locked file
XIO 40,#1,4,0,"D:PROG.OBJ" - loads and runs a binary file
(like "L" in Atari and MyDOS)
XIO 40,#1,5,0,"D:PROG.OBJ" - loads a binary file
(like "L" in Atari and MyDOS with the "/N" option)
XIO 41,#1,0,0,"D:GAMES" - changes default directory that
drive/subdirectory (all calls to "D:" will now occur within
that drive/directory)
XIO 254,#1,0,0,"D2:" - FORMAT a disk (in Atari DOS 2.5, this is
format 'enhanced', to format 'single' density, use XIO 253)
(in MyDOS, this is format, but not 'enhanced', use
XIO 253,#<channel>,1,0,"D<drive>:" for format a drive in enhanced
mode).
NOTE: 39 and 40 are the same. Also note the useage of AUX1 in the
"XIO 40" example.

---=== Getting Atari files to an IBM: ===---

Q.1) How can I read Atari disks on my IBM?
A.1.1) If you have double-density Atari disks, you can use the program "Util" on the IBM which can read double-density Atari disks. Please see the Atari 8-bit FAQ for more details.
A.1.2) If you have an Atari 1050 disk drive, you can use the program MULE to copy files, one file at a time, 20k chunks at a time, from the Atari to the IBM. You first must format a 180k disk on your IBM, the run MULE on your Atari to get a file onto the MULE disk, then run MULE on the IBM to get the file onto the IBM. Tedious, isn't it? MULE wasn't meant to be a fully-functional program, just a demo to show that this was even possible.
A.1.3) If you're fortunate to have a Black Box interface on your Atari, you can get an external IBM drive and the Black Box's add-on, the Floppy-Board and simply copy files from your Atari disks or hard drive(s) onto IBM disks via the floppy board, then load them up on your IBM.

Q.2) Ok, I can't do any of that, now what?
A.2.1) You can use SIO2PC, which is a program for IBM's which turns your IBM into a set of Atari disk drives. You need the SIO2PC cable (which you can purchase, assembled or unassembled, or buy parts and build it yourself) and the SIO2PC software (available at UMICH). Connect your IBM to your Atari, load SIO2PC, and then run the program FILE2PC on the Atari to transfer files to the IBM's hard drive. Or instead create a disk image within SIO2PC and copy files from one disk (a real Atari floppy) to another (the SIO2PC image) with the Atari or MyDOS "C"opy command. If you want to extract files out of the SIO2PC disk image file and store them on your IBM's hard drive or floppies as single files, either again use FILE2PC or use S2PC, an IBM program which can extract files from or add files to MyDOS-compatible SIO2PC disk images!
A.2.2) You can use two modems to download files from your Atari 8-bit.
A.2.3) If you don't necessarily want files that you already have on your Atari 8-bit, you can download files from the huge collection available at FTP sites and Atari 8-bit supporting bulletin boards and save them onto your IBM.
A.2.4) If you have only one modem, so you can't connect both your Atari 8-bit and your IBM together via modems, you can do it via null-modem, OR you can upload files from your Atari to some bulletin board or account you have access to, and then connect the modem to your IBM and download the files.

Q.3) Is there any easier way to get Disk Communicator (Atari disk image) files to and from SIO2PC disk images other than using Disk Comm. on my Atari! I mean, both files are disk images! They're both on my PC's hard drive! <cry>
A.4) Yes! There's a (currently it seems buggy) new IBM program out called DCM2DSK. (Why "DSK" and not "ATR", I don't know.) The current version is '0' and it's available at UMich's archives and probably elsewhere. Filename: "DCM2DSK0.ZIP" in the SIO2PC directory.

---=== Where to FTP files mentioned in this FAQ: ===---
The PC X-Former can be downloaded from the "ftp.clark.net" FTP site:
Directory/file-path: systems/msdos/emulators/xf2.zip
The following programs are availabel at the "archive.umich.edu" FTP site:
SIO2PC: atari/8bit/sio2pc/*.* [all files are SIO2PC/utility files]
MULE: atari/8bit/Utilities/????
Util: atari/8bit/Utilities/????

AGAIN, >>> PLEASE <<< CHECK OUT THESE OTHER FILES:

recently bought an atari 2600.

I know it is ancient but it is still fun.

I am looking for games especially Kaboom.

I am interested in any games.

Send me the names and prices.

I will get back to you soon.

Thanks.

tfunk@matt.ksu.ksu.edu

Why emulate an Atari 8bit on your 486? I've got ONE answer most people will agree with (although I can't say this from experience)...

M.U.L.E.!

I have one question, how do you make the VT100 LEDs work? Also, Bobterm
uses regular CTRL+arrow key combinations, not SHIFT+CONTROL+arrow keys. I
still use AnsiTerm instead of Flick80.

================================================================

"All" commercial vendors and developers should be listed here. "Major"
shareware developers are also listed.

8-bit Atari magazines, both print and disk, are covered in the 8-Bit Atari
FAQ List, available separately.

GEnie, Delphi and CompuServe addresses can be accessed via the Internet:
Genie users are Genie.name@genie.geis.com
CIS users are #####.####@compuserve.com
Delphi users are delphiname@delphi.com
```

Telephone number coversion table:
2=ABC 3=DEF 4=GHI 5=JKL 6=MNO 7=PRS 8=TUV 9=WXY

When writing to request catalogs, it's always a good idea to include a Self-Addressed Stamped Envelope.

When writing to foreign firms, try enclosing a couple of International Reply Coupons (IRC's) as well.

Special thanks to Dave Paterson, GEn: D.PATERSON2, for his efforts at confirming the entire contents of this list in 1994!

==========

This list won't be accurate and complete without YOUR help!

I think the 6507 also had 128 bytes of on-chip RAM as well as one or more
I/O ports. I could be wrong though, I'm going from memory.

5136. .DSK Extension: A disk image file?

Newsgroup: comp.sys.atari.8bit
Date: 1994-09-07 21:40:47 UTC
From: ah818@freenet.buffalo.edu
Message-ID: <Cvs480.6r5@freenet.buffalo.edu>
Source record: 98617

I've been trying to find a forth language for the Atari 8bit, and down-
loaded the one on the UMich archive. When unarced I ended up with two
files with a .dsk extension. Just on the off chance that these might be
mislabled .dcm files I tried to convert them with dcmtodsk. They are not
.dcm files. Might these possibly be just staright dumps of the original
disks? Or maybe an image format that I haven't heard of?

I'd also be interested in any pointers to 8bit forths that anyone might
be willing to provide. Particularly where they might be obtained or
where one might find dovumentation.

Oh, yea. I'm working on an 800XL. I'm also not well versed in the 8bit
world. Haven't touched my Atari in the past 8 years, and never did any
system level work with it back then. I can generally follow the conver-
sations on this board, but I'd hate to have to repeat them to someone
else.

I wonder, following the general conversatioons of this board, why the
8bit Atari hasn't been marketed as a lab kit to high schools and junior
highs? It seems to me that this is a good machine for e[eriementing wih
systems level code and exotic language implementations. With schools
starting to drop basic as their introductory language and switch to C,
etc, one notes that all these basic lan - er, fundamental languages -
are avainable for the Atari also. And you can eperiment to your heart's
content without worrying about blowing up the class' main stay Mac or
PC. I guess, from what I've read here, that even the assembler language
for the 6502 is fairly easy to laern? Just a thought.

From: curtis@darkwing.East.Sun.COM
Message-ID: <34ld1e$947@walters.East.Sun.COM>
Source record: 98587

Why would PC folks want an Atari emulator ?

Well, being a PC and Atari owner, I can give some reasons
(as I too want a good emulator... XF2 is the best I've seen to date)

1. An ex-Atari owner, looking to enjoy past glories w/o having to
hunt, buy, and possibly fix an Atari....
2. A current Atari owner, who wants to run the occasional Atari classic
without having to resort to using the Atari all the time. (I myself
am sort of multi-homed... and don't feel like setting up an Atari at
both locations).
3. To play M.U.L.E (kinda goes w/1 and 2... :-)

For example, I am covered by reason 1 with respect to Apple][.
I am covered by reason 2 (and 3) for Atari.

Maybe you like having 4 computers all set up in one place (maybe you have
the room to do this... maybe you have the room to do so in two places...
I know I don't). This magic # 4.. comes from: PC, Atari, C64, Apple

Well, just my opinions on emulators..... not to mention, as time goes
on, getting parts, and maintaining the classic Ataris will become more
difficult.

Also, regarding issue #1... it seems that classic Atari prices have risen
somewhat in the past few years .... either that, or their are less sellers
and most sellers are those trying to earn a few extra bucks by buying
bunches of stuff at a time, and reselling for best dollar they can get....

Source record: 98608

I pulled out my old 1802 stuff because of some of the statements about relative merits of different processors. Stuff is so old it looks like the Dead Sea Scrolls. Anyway, there may be a few errors in this because I'm doing it off the top of my head on a word processor. There's other ways of doing it, but:

POINT #1 Size of code vs 6502
POINT #2 can page zero be considered registers

Let's say you want to do a simple memory move, 6502 would be something like 4 pages $2000M TO $4000M:

```
LDA $40
STA DEST+1
LDA $00
STA DEST
LDA $20
STA START+1
LDA $00
STA START
LDX #$4
LDY #$0
LOOP1
LDA (START),Y
STA (DEST),Y
DEY
BEQ LOOP1
INC START+1
INC DEST+1
DEX
BMI END
BPL LOOP1
END
BRK
```

I get about 37 bytes with the BRK at the end. On an 1802 the same thing would go something like this <REM: I never learned 1802 nemonics>. Note the equivalent of the 6502 A reg is called D on the 1802:

```
$F8 $40 LOAD D REG WITH HIGH DEST
$B1 PUT IT IN HIGH PART OF REG #1
$F8 $00 LOW IN D
$A1 PUT IN LOW PART OF REG #1
$F8 $20 SOURCE LOAD AS ABOVE
```

```
$B2 REG #2
$F8 $00
$A2
$42 LOAD D WITH DATA POINTED TO BY REG #2
$51 STORE CONTENTS OF D @ REG #2 POINTER
$12 INC REG #2 THIS IS A 16 BIT INC
$11 INC REG #1 DITTO
$91 GET HI REG #1
$FB $07 COMPARE: HAS IT BEEN INC FROM 4 TO 8?
$3A $0C BNZ $0C BACK
$00 IDLE/HALT
```

22 bytes. Both could have been written smaller, but both used the same style of programing & it illustrates my point #1 on size of code very well. Most other examples I could think of such as branching, math, subroutines, etcetera are similar. I haven't really delved that much into Z80 & 80xx, but what I have seen shows a similar reduction in memory requirements. Aside from the power restrictions of running on a Plutonium based thermoelectric supply, the 1802 WAS the right choice for Voyager when you consider the size of cmos rams available when it was built.

Point #2 the 6502 can use page zero memory locations to perform some register like functions, but so few that it doesn't make a lot of sense to say they are the same as real registers. For example, you can also do a JSR($5000), but you wouldn't consider saying there's 64k of registers in a 800xl. *IF* they could be used in a single op code like TAY or TXA then they would qualify, but if it looks like a duck, walks like a duck, quacks like a duck, it's memory. I've even heard about some Z80 designs that don't even use ram, just a ROM with the program & internal registers for all data storage & manipulation. Try that with a 6502 & you'll really see some of the limitations we have.

The 6502 is my processor of choice, but I can see why some people prefer other processors. A limitation of the 1802 is you only have a maximum o 7 hardware devices, since a 6502 uses memory mapped devices, it's only limited by address space. You could do memory mapped stuff on a 1802, but then you lose some of the features that make the ability to have 7 hardware devices directly accessible by the processor desirable.

: I have one question, how do you make the VT100 LEDs work? Also, Bobterm
: uses regular CTRL+arrow key combinations, not SHIFT+CONTROL+arrow keys. I
: still use AnsiTerm instead of Flick80.

You have to find a utility that uses the LEDs. Unfortunately I have found none, but I did try testing it by cat-ing text files with the escape codes in them and they work.

As for the arrows, there are 2 ways to do it. If you HAVE to use the same keys as the arrow caps, use select and normal arrows. Else use shift control with the goofy < and >. Bobterm does not support VT100 arrows at all. You can not read sh^Left arrow and sh^Right arrow from the keyboard so that's why Kermit and Flick chose < and >.

Also, regular ^^, ^\, and ^_ have their unique ASCII codes associated with them. Clay thought about moving them up to the top row of numbers but decided to keep them where the keycaps have them. Pico uses some of these hotkeys for instance. Therefore using straight control arrows was out of the question.

You must appreciate that every decision made in the key mapping was considered heavily before finalization.

If you like Ansiterm, more power to you. I won't waste my 14.4 on it.

The Apple became the educational machine, not the Atari. It's ironic because the Atari is easier to plug+play than the Apple and it has more eye-catching graphics and games to appeal to kids but that's life.

>This is directed at Atari emulators for PCs....
>
>regarding joystick emulation, etc....

[stuff about using 4 printer ports deleted]

Those are interesting suggestions. Seeing as how PC Xformer 3.0 will be released in a few weeks I can't say that I'll have time to add any sort of "printer port reading joysticks" support, but it's an idea for future versions. Maybe those German guys who produced the laughable 800XL emulator might give it a try <grin> since you did direct your posting at anyone writing 8-bit emulators.

I do have one request of you and anyone else planning to use the 130XE version of PC Xformer. I need 130XE demos!!!!

If you can email me specific names of files and ftp sites where I can find them, I need p/d demos or games that specifically require the use of a 130XE or 320XE. Not an 800XL, not a 65XE, not a 400/800.

PC Xformer 3.0 will include two versions on the disk, one a 130XE emulator, and one a 320XE emulator (a 130XE that has 256K of extended memory instead of only 64K), so I need to have those features well tested over the next few weeks.

In a previous article, kendrick@zippy.sonoma.edu (William Kendrick) says:

>Why emulate an Atari 8bit on your 486? I've got ONE answer most people will
>agree with (although I can't say this from experience)...
>
> M.U.L.E.!

That's very true. Not to mention the possibility of *archiving* many
programs (yes, GAMES mostly, in my case) available ONLY on the 8-bit platform.

I believe the proper word is "nostalgia". M.U.L.E. is one example. There
are PLENTY of titles out there that were never released for the PC or Mac or
any other "current" or "more sophisticated" platform, and the gameplay in
many of those far surpasses that of many PC/Mac titles out now (but -- I'm
not saying that they're all better than DOOM! ;-)

Not to mention the fact that the Atari 8-bit is a wonderful machine, and
some people (myself included) enjoy working on it from time to time...

5153. Ice-T in color? bold?

Newsgroup: comp.sys.atari.8bit
Date: 1994-09-08 22:30:39 UTC
From: bruck@brachot.jct.ac.il
Message-ID: <9409082229.AA00601@brachot.jct.ac.il>
Source record: 98615

Ice-T cannot be in color, since no I/O, or 80-column bit-mapping can be done
with the 6502 taking up 99% of program time changing the pallette each
scanline.

Ice-T can't have bold characters either. PMGs used to enhance characters
need a FT-like display to work.
Everybody put on their thinking caps, and figure out why. (hint: How many
sprites does the Atari have?)

As for ANSI and stuff, well, the program's using up the 48K it's
allowed to. I don't know how, and if I'm allowed, to use anything
above that. Nobody's helped me on this, so I guess it's everybody's loss.
Add that to the fact that I don't have an expanded machine.
And my disk drives and my SIO2PC'ed PC are all dying.

v1.0 betabugger will, unfortunately, have to be released in its
current state.

Faster generally, more reliable, a few fixed VT100 weirditudes
Fine scroll(with bug in up-scroll)
Back scroll
X-modem, with bug NOBODY's helped me solve (thanks guys).
A few annoying bugs I haven't managed to kill.

SOON.

-itay

5 sprites (missiles as a 5th PMG) means 5*8 bits = 40 bits bandwidth.
Fills screen with (quad?) width.

I don't think FlickerTerm is accurate to every 80 collumn character when
it comes to bold. I'm not sure it can be. I think it would work with a
Gr.8 screen too.

: I think the 6507 also had 128 bytes of on-chip RAM as well as one or more
: I/O ports. I could be wrong though, I'm going from memory.

I think the 128 bytes in the 2600 come from the RIOT chip, not the CPU,
but I'm not certain.

5157. For sale

1 130XE. Works perfectly. Also some random game carts, Defender,
Asteroids,
Missile command, Centipedes etc.

Best offer takes it.

Please reply via email.

5158. PCTASK running SIO2PC on Amiga

Newsgroup: comp.sys.atari.8bit
Date: 1994-09-09 02:25:02 UTC
From: krishna@max.tiac.net
Message-ID: <34oh1u$qm7@sundog.tiac.net>
Source record: 98627

This is aimed at Atari 8-bitters who also have Amigas. Have you managed to run SIO2PC on the Amiga using PCTASK and use the stock serial port to interface to the 8-bit? I'd assume the standard I/O speed of 19.2K would be all you could pull at best...

Category 5, Topic 7
Message 16 Sat Sep 03, 1994
MYTEK [MIKE] at 21:08 EDT

**** ATTENTION - LIMITED TIME OFFER ****

Prism Studio's very future, rest's in your hands. I am looking for SIX confirmed orders to appear by March 1st 1995.

Yes, that's right, I said it's future depends upon receiving these orders by the deadline date mentioned.

To some this may seem strange, but to anyone who is trying to market a product to the ever shrinking 8Bit Atari user base (or has tried and died), you know the reality of the saying "When in a business for oneself, it is wisest to use other peoples money to produce product, than to use your own". This seems to be especially true in this marketplace, where you may only sell one or two of something, hardly enough to justify the cost of having professionally made P.C. Boards made. It is for this reason, I need to see a minimum number of orders, before setting the production wheels rolling. I have already written off the R&D time and materials this product required to materialize, but I simply can't afford to sink any more money into the venture, if it isn't what people want or need.

Here's how it will work: between now and March 1st, I will accept orders at the going rate of $184 ($179 plus $5.00 S&H), preferably these orders should be via personal check written out to MYTEK. I will HOLD these checks until the required number of orders has been met, at which time they would be cashed and production would begin. If the required number is not met, than all checks will be returned to their owners, and the Prism Studio project will be shutdown. If you want COLOR genlocking on this platform, than please don't let this happen. If for whatever reason, you change your mind about waiting for the product, and assuming you had previously sent in a check, I will promptly return your check if requested, with no hard feelings.

This really is a good deal for such a product as this (compares with similar units on the IBM platform going for $300 or more), don't take my word for it, check out the review in the June/July issue of Current Notes. If you support this product, then I will support you, by offering other products to expand upon this one, adding even more features.

When the SIX orders have arrived, I'll let everyone know personally
with a phone call, that has made this possible (be sure to include your phone#
when you order).

Once again: Order Info....

MYTEK

Petaluma, CA 94975-0396

Thanks, sincerely, Michael St. Pierre (2nd Mike?)

5160. FOR SALE: Atari 8-bit Stuff

Newsgroup: comp.sys.atari.8bit
Date: 1994-09-09 04:21:08 UTC
From: tdrake1@umbc.edu
Message-ID: <34onrk$7sp@news.umbc.edu>
Source record: 98630

I have the following items for sale:

U-Print A Parallel Printer Interface - $15.00

2 Atari ST mice (can be used with the 8-bit)
one is the original ST mouse - $10.00 each

1 320K RAM Atari 130XE with RAMROD OmniOS chip
(with docs) has three OSs built-in with 80 column
mode and 1.5 amp power supply (sealed black one). Includes a 4-jack
monitor cable. $85.00

1 256K RAM (Newell compatible with docs and technical data) Atari 800XL
with Atari Classics SuperVideo 2.1 upgrade (an outstanding picture on a
split chroma-luma composite monitor!) with chroma/composite only switch.
You have to see it to believe it! Brilliant colors when used on a decent
split chroma-luma monitor like the Commodore 1084! Includes a 4-jack
monitor cable. - $75.00

1 highly modified Atari 800 with Newell RAMROD XL (includes the FASTCHIP
XL floating point routines in ROM, which can give you up to 4 times! the
speed of the original and keyboard speed is doubled in speed, OMNIMON,
RAMDISK handler (up to 256K RAM for a total of 288K!), original owner's
manual, power supply, coldstart switch,
and more! 52K RAM mode! Switch selectable. Graphics modes 12, 13, 14,
and 15 have been added. Improved baud rate from cassette (up to 1250!)
This is twice as fast as normal! Full
instructions, technical data are provided. Yes, it
will play a 4-person game of M.U.L.E.! - $90.00

You pay shipping.

Send e-mail if interested.

Welcome to the comp.sys.atari.8bit/Info-Atari8 Digest/INFO-A8 discussion group!

Atari 8-Bit Computers

Vendors and Developers List

Revised 2-Sep-94

Additions/suggestions/comments/corrections having to do with this
Vendor/Developer List are requested. Please send to:

Michael D. Current
mailto:mcurrent@carleton.edu
UUCP: ...!umn-cs!ccnfld!mcurrent
Cleveland Free-Net: aa700

Where to get the latest copy of the Atari 8-Bit Computers
Vendors and Developers List:

ftp://rtfm.mit.edu/pub/usenet-by-group/news.answers/atari-8-bit/vendev
(and many other FTP sites that archive Usenet FAQ Lists)
http://www.cis.ohio-state.edu/hypertext/faq/usenet/atari-8-bit/vendev/faq.html
news:comp.sys.atari.8bit, news:comp.answers, news:news.answers

or, send a message to mailto:mail-server@rtfm.mit.edu that says:

send usenet/news.answers/atari-8-bit/vendev
quit

Finally, you can always ask me for a copy at mailto:mcurrent@carleton.edu

================================================================

"All" commercial vendors and developers should be listed here. "Major"
shareware developers are also listed.

8-bit Atari magazines, both print and disk, are covered in the 8-Bit Atari
FAQ List, available separately.

GEnie, Delphi and CompuServe addresses can be accessed via the Internet:
Genie users are Genie.name@genie.geis.com
CIS users are #####.####@compuserve.com
Delphi users are delphiname@delphi.com
```

Telephone number coversion table:
2=ABC 3=DEF 4=GHI 5=JKL 6=MNO 7=PRS 8=TUV 9=WXY

When writing to request catalogs, it's always a good idea to include a Self-Addressed Stamped Envelope.

When writing to foreign firms, try enclosing a couple of International Reply Coupons (IRC's) as well.

Special thanks to Dave Paterson, GEn: D.PATERSON2, for his efforts at confirming the entire contents of this list in 1994!

5162. Is Anyone Using Quick?

Newsgroup: comp.sys.atari.8bit
Date: 1994-09-09 10:21:23 UTC
From: Simon.Brownlee@CEN.JRC.IT
Message-ID: <34q68s$6al@dicscs4.jrc.it>
Source record: 98638

So, is anyone else using Quick? I recently bought a copy, and have been busy putting together a few demo programs (and getting used to some of it's bad points).

But there seems to be a serious lack of example source code about. I've got the English version of the support disk, but I'd really like some examples or documentation on multitasking and using the ramdisk for compiled subroutines.

I remember reading that the QuickMagazin is published in Germany. Are any copies translated into english, or will I have to stick with the german version. Is it even available outside of Germany?

Any help from any Quick programmers would be welcome.

Be sure the ST138N formats 256 byte sectors or you're out of luck with
that drive.

5167. Re: Sparta X and Integrat

Newsgroup: comp.sys.atari.8bit
Date: 1994-09-09 16:20:21 UTC
From: aa700@cleveland.Freenet.Edu
Message-ID: <34q205$3r5@usenet.INS.CWRU.Edu>
Source record: 98633

In a previous article, pab@cnx.sccsi.com (Pab Sungenis) says:

>SpartaDOS X uses $CFFF for banking, as Axlon memory boards did, in an
>Atari 800.
>
>There is no way to use SDX in a stock 800.

I guess it depends on what you mean by "stock." It certainly works in a 48K
800. Usability is limited, as you have to "use none" so it takes up a
large chunk of user memory. Also, some commands (I'm thinking ARC
included) don't work because there isn't enough memory available. But you
can definitely use SDX with an 800 lacking an Axlon upgrade.

From: aa700@cleveland.Freenet.Edu
Message-ID: <34q2f2$4le@usenet.INS.CWRU.Edu>
Source record: 98634

In a previous article, MIS0160@MVS.UDEL.EDU (Roger Cole) says:

>Has anyone received a copy of the "New" Atari Classics magazine. I
>received a postcard in early August stating that the first issue would
>be sent first class mail 'during the last week of August.' I would
>imagine that if mailings went as advertised it shouldn't take 9 days
>for first class mail to reach the east coast.

I'm not too concerned yet. Considering the ambitious schedule they
assigned to themselves, I figure they deserve at least a month's leeway
before we start panicking. My impression is that they're bound and
determined to make their version of AC a success. If it takes them an
extra few weeks to get started, so be it.

You can bet you'll hear about it here when they do get an issue out the door.

Rockwell's processors (C29, C39, C40, etc...) are pretty much what you
describe. Some varient runs DSP and controller functions on their 28.8
and 14.4 modem chipsets...

They're clocked obscenely fast-- anyone for a 40MHz 6502? :-)

5170. Atari 5200 cartridge hacking?

Newsgroup: comp.sys.atari.8bit
Date: 1994-09-09 19:16:53 UTC
From: clay@supra.com
Message-ID: <34qcb5$d00@v_mail.supra.com>
Source record: 98646

Has anyone out there done any Atari 5200 -> Atari 800 (whatever)
conversions?

A *long* time ago I was working on PacMan and Gremlins and never
finished. I just got a 5200 "meteroids" cart that I'm curious to
try to port...

Any info appreciated.

5171. Power supply list nearing completion!

Newsgroup: comp.sys.atari.8bit
Date: 1994-09-09 21:09:41 UTC
From: mcurrent@blue.weeg.uiowa.edu
Message-ID: <Pine.3.89.9409091604.A139286-0100000@blue.weeg.uiowa.edu>
Source record: 98460

PLEASE check your collection of Atari power supplies and let me know of
any discrepancies between what you have and what I list. All details are
important!

Power supplies for 8-bit Atari computers and peripherals

The most important information is the voltage (in volts) required, and
whether you need a transformer (AC output) or an adaptor (DC output). The
power (in watts) and current (in amperes) specifications of the original
equipment as presented here should be regarded as minimum values.
Higher-than-specified power and current capacities are entirely usable,
and often preferable because such supplies run cooler and last longer.

Power (in watts) = current (in amps) * voltage (in volts)

9 V AC 5.4 VA (600 mA) Atari#CO62195 transformer:
1030

9 V AC ???? VA (??? A) Atari#CO61516 transformer:
1010
9 V AC 15.3 VA (1.7 A) Atari#CO14319 transformer:
400,800,822,850,1010,1200XL
9 V AC 18 VA (2.0 A) Atari#CA014748 transformer:
400,800,810,822,850,1010,1200XL
9 V AC 18 VA (2.0 A) Atari#CA016804 transformer:
400,800,810,822,850,1010,1200XL
9 V AC 31 VA (3.4 A) Atari#CO17945 transformer:
400,800,810,822,850,1010,1200XL,1020,1050,XF551,256K FTe MIO
9 V AC 50 VA (5.6 A) Atari#CA017964 transformer:
400,800,810,822,850,1010,1200XL,1020,1050,XF551,256K FTe MIO

9.5 V AC 40 VA (4.2 A) Atari#CO61636 transformer:
1027

5 V DC 1.0 A (5.0 W) Atari#CO70042 adaptor:
65XE,XE Game System
5 V DC 1.5 A (7.5 W) Atari#CO61982 adaptor:
600XL,800XL,65XE,130XE,XE Game System
5 V DC 1.5 A (7.5 W) Atari#CA024814 adaptor:
600XL,800XL,65XE,130XE,XE Games System
5 V DC ??? A (??? W) Atari#CO81982 adaptor:
XL/XE

9 V DC 500 mA (4.5 W) Atari#CO16353 adaptor:
XEP80,SX212,2600
9 V DC 500 mA (4.5 W) Atari#CA014034 adaptor:
XEP80,SX212,2600

9.3 V DC 1.93 A (18 W) Atari#CO18187 adaptor:
Indus GT,1 Meg FTe MIO,5200
11.5 V DC 1.95 A (22 W) Atari#CA019141 adaptor:
Indus GT

5 V / 12 V DC 1.1 A (5.5 W / 13.2 W) Atari#CO62297 adaptor:
1400XL,1450XLD

These draw their power from the SIO +5 V:
XM301 (60 mA);FTe P:R: Connection

These have built-in power supplies (plug directly into the wall):
410,815,820,825,1025,1029,XMM801,XDM121

The power supply requirements for the following are still needed:
??? V DC ???? A (???? W) Atari#CA016751 adaptor:
830
??? V DC ???? A (???? W) Atari#CA060535 adaptor:
835
XC11 program recorder (no brick needed -> internal or SIO source?)
XC12 program recorder (no brick needed -> internal or SIO source?)

Message-ID: <CvvsDx.A7u@cerc.wvu.edu>
Source record: 98651

From article <34ljef$3ed@sundog.tiac.net>, by krishna@max.tiac.net (Glenn M. Saunders):
> The Apple became the educational machine, not the Atari. It's ironic
> because the Atari is easier to plug+play than the Apple and it has more
> eye-catching graphics and games to appeal to kids but that's life.
>
>
Giving a free computer to each school (in cal. I believe) is prob. why the
apple took off so well. It was one hell of a marketing coup. If only Atari
could have been so bold. <sigh>

From: F Tooned <ftooned@delphi.com>
Message-ID: <Zq2xHWC.ftooned@delphi.com>
Source record: 98645

Hi Everybody,

Things are still very busy here at FTe. The catalogs are still running
late, but there will be a nice ad appearing in the "new" Atari Classics.
(Which should be out in a few more weeks) I haven't forgotten about
anyone, and after I can get a few LARGE projects out of the way, I
will have a lot more time to get back on-line.
I am planning on going to Germany in October, so if anyone has info
on the ABBUC show and dates, please drop me a line via E-Mail.
Thanks to everyone for patience and support! Things are getting
better, so I'm optimistic about getting the new stuff into production
very soon. More on this later.

Does anyone have any information on the DCM disk format? I am looking for any information that I can use. I would like to write a atr/xfd to dcm disk conversion program in C, so I can atleast use these .ATR and .XFD format programs. I could always use XF2, emulate the disk and run DISK COMMUNICATOR, but I would rather not waste my time with an emulator.

The 5200 versions of Space Invaders and Centipede (which have
better graphics than the 8-bit cartridge versions) have also
been ported to the 8-bits. I've never seen a copy of
Meteroids though.

Hint: if you have the 5200 versions (Gremlins, Moon Patrol,
Mario Brothers) load a Translator on XE machines (use the
400/800 OS) because the sound will be dramatically improved.
(Especially on Gremlins.)

Hmmmm,

It really is too bad that Atari didn't market iteself approriately for
the times. Interestingly thopugh, I think, maybe, there is a trend
out there to turn back to some basics and reevaluate the direction
that computer programming/languages took a few years back. I find it
interesting to note that recent trends in the concepts of genetic
programming were brought to the fore again by John Holland at UMich
by coming up with the concept of the genetic algorithm. Know how he
developed that concept? On his Commodore home computer with 8k of
memory, and coded the thing in binary (yep, not assembler.). Of course,
Holland has been around since the beginning, being a member of rthe
development team for IBM's very first computer. (early 50s, I believe),
I just find it interesting that he came up with this idea by cutting
back to the basics and not allowing himself to be restricted by limitations
that choosing an advanced o processor or language might put on his development
work.

Likewise, there seems to be a similar trend in people looking at forth
as a viable language; precisely because you can get back to bits and bolts
of your machine with the language and because its not as restrictive as
the languages that have developed over the past few years, e.g. C, C++, Lisp,
etc. Maybe the 6502 isn't as "old" and "outdated" as many people might
have one believe. After all, usefulness is defined by your ovjective.

This is a cool book. Kinda rare too I think. All the PMG handling is
via strings which is interesting.

5187. TurboBASIC XL time fix

Newsgroup: comp.sys.atari.8bit
Date: 1994-09-10 16:13:00 UTC
From: ac941@leo.nmc.edu
Message-ID: <9409101620.AA03960@leo.nmc.edu>
Source record: 98641

Friends,

I captured the following post back on Sun, 10 Jul 1994 02:33:56 GMT.

Begin>>>

Subject: USA TBXL Runtime

I'm wondering where I can get a copy of the TurboBASIC XL runtime package which has a fixed clock (ie, doesn't gain 10 seconds per minute.. inotherwords, it goes from 0:00 to 1:00 when in reality, a stopwatch or something would only say 0:50) ???

Thanx
-bill
---
reply

Hi Bill,

This comes to you courtesy of Ted Skrecky (I'm not on InterNet). He usually captures comp.sys.atari.8bit and passes it on via our club BBS.

I'm glad you raised the question as, when I patched Turbo for NTSC, I never thought about RUNTIME since I shun (read "despise") compilers and have little interest in BASIC except as a handy calculator. The only reason I did the fix in the first place was to see if it could be done. Subsequently, there never was a "TurboBASIC XL runtime package which has a fixed clock". There is as of now.

The code for time functions in all versions of Turbo (XL, 800 aka Frost, and Tom Hunt's Sparta mod) is identical albeit at different addresses. Your query lead me to put RUNTIME through a disassembler and I discovered that the code is only slightly different and again, at a different address.

If you load RUNTIME into TextPRO or a Turbo string and do two simple substitutions, the same patch should be effected. First you find a floating point number for vblanks per day (24x60x60xvbi/second). The PAL value is 4.32*100^3. For NTSC, this needs to be changed to 5.184*100^3. To do this find the byte sequence 67,4,50,0,0,0 (should be at byte 9806 counting from 1) and substitute bytes 67,5,24,64,0,0

Bytes 9854-9859 consist of two JSR's, one to a multiply by 5 routine and the next to a multiply by 10. For NTSC, this is changed to a single call to a multiply by 60 routine and three NOP's. So find 32,12,252,32,6,252 and substitute 32,45,252,234,234,234. Neither "find" sequence occurs anywhere else in the program.

I took a test clock program I'd written for the interpreter mod, compiled it, and ran it over a five hour period. It lost about 20 seconds which is the same as the modified interpreter and similar to Sparta's TDLINE.

If you want more info, I can be contacted on the USF net (cross netted with the Forem net) under the enigmatic handle of my initials "jkp". Of course, you could also hurl invective at me through Ted via InterNet <g>.

John Picken

<<<End

This is much appreciated for the Turbo Runtime module. However, I seem to have missed any posting on how to fix TurboBASIC XL itself. Could someone please pass on the substitutions that will cause TurboBASIC XL to run time properly with NTSC power?

Thank you in advance!

>compression which effectively quadruples text transmission rates.
>Basically the speed is choking the 8-bit.

I can understand this being the case if a big chunk of text were coming
in from the modem and either the 850/Atari buffers are filling up OR
the hardware chips themselves couldn't cycle fast enough -- but would
this still be true when all I'm doing is typing a few characters OUT
to the modem (ATDT511<CR> for instance)? Surely there's nothing much
to "keep up with" at hunt-and-peck typing speeds?

I could understand the Atari hardware being "unable to keep up" at
the bit, or individual character, level, but then how do you explain
that the Atari side can talk directly to my Amiga at 9600 with no
problems? I'm still not convinced we've solved the case.

I have an 850 with a LineLink 144e (cheap 14.4 fax/modem) and I run it at 9600 baud using Bobterm. I have the same problem of the modem not being able to accept commands. I found that if you go to terminal mode and type a bunch of a's then go to dial, it will work everytime. Apparently, the modems train their baud rate on the "a" of the "at" and the 850 confuses this training (must be some timing problem in the bit stream). But, apparently the modems can get synced up if you give enougn a's. From that point on, there seems to be no problem with the 9600 baud rate -- files transfer just fine. I also tried a P:R: Connection and it is not quite as good as the 850 - I could not use 9600 baud with it.

Telephone number coversion table:
2=ABC 3=DEF 4=GHI 5=JKL 6=MNO 7=PRS 8=TUV 9=WXY

When writing to request catalogs, it's always a good idea to include a Self-Addressed Stamped Envelope.

When writing to foreign firms, try enclosing a couple of International Reply Coupons (IRC's) as well.

Special thanks to Dave Paterson, GEn: D.PATERSON2, for his efforts at confirming the entire contents of this list in 1994!

==========

This list won't be accurate and complete without YOUR help!

5196. Atari 8-Bit Computers: Vendors and Developers

Newsgroup: comp.sys.atari.8bit
Date: 1994-09-11 10:48:22 UTC
From: Michael Current <MCURRENT@carleton.edu>
Message-ID: <atari-8-bit/vendev_779280501@rtfm.mit.edu>
Source record: 98471
Cross-posted to: comp.sys.atari.8bit,comp.answers,news.answers

```
Archive-name: atari-8-bit/vendev
Posting-Frequency: monthly

Welcome to the comp.sys.atari.8bit/Info-Atari8 Digest/INFO-A8 discussion group!

Atari 8-Bit Computers

Vendors and Developers List

Revised 2-Sep-94

Additions/suggestions/comments/corrections having to do with this
Vendor/Developer List are requested. Please send to:

Michael D. Current
mailto:mcurrent@carleton.edu
UUCP: ...!umn-cs!ccnfld!mcurrent
Cleveland Free-Net: aa700

Where to get the latest copy of the Atari 8-Bit Computers
Vendors and Developers List:

ftp://rtfm.mit.edu/pub/usenet-by-group/news.answers/atari-8-bit/vendev
(and many other FTP sites that archive Usenet FAQ Lists)
http://www.cis.ohio-state.edu/hypertext/faq/usenet/atari-8-bit/vendev/faq.html
news:comp.sys.atari.8bit, news:comp.answers, news:news.answers

or, send a message to mailto:mail-server@rtfm.mit.edu that says:

send usenet/news.answers/atari-8-bit/vendev
quit

Finally, you can always ask me for a copy at mailto:mcurrent@carleton.edu

================================================================

"All" commercial vendors and developers should be listed here. "Major"
shareware developers are also listed.

8-bit Atari magazines, both print and disk, are covered in the 8-Bit Atari
FAQ List, available separately.

GEnie, Delphi and CompuServe addresses can be accessed via the Internet:
Genie users are Genie.name@genie.geis.com
CIS users are #####.####@compuserve.com
Delphi users are delphiname@delphi.com
```

Telephone number coversion table:
2=ABC 3=DEF 4=GHI 5=JKL 6=MNO 7=PRS 8=TUV 9=WXY

When writing to request catalogs, it's always a good idea to include a Self-Addressed Stamped Envelope.

When writing to foreign firms, try enclosing a couple of International Reply Coupons (IRC's) as well.

Special thanks to Dave Paterson, GEn: D.PATERSON2, for his efforts at confirming the entire contents of this list in 1994!

==========

This list won't be accurate and complete without YOUR help!

Hi there,
some people are waiting for uue.-mails from me fro following software
-XFTOOLS a disk with very good software for standart xf551 (great)
-Inteloutside.iff one of different intel-outside pics from my amiga
-some more.. I do not know all

The reason is the bbs where I have acces to the Internet sometimes has
problems and now there is a problem again.
It is also not possible to sent to the archive (shit)
SO guys please wait 8 days more..

Well, here's the list of what I have. If you want something, make an offer and let me know. I would greatly prefer to get rid of everything to the same person, so preference will be given to anyone who wants everything.

800- Died a couple of months ago. Quit working during an Omniwriter session, which was a real bummer. Screen locked up and refused to respond to system reset; I swapped processors without luck. Probably an easy fix. Has Omnimon/Omniview board installed.

800XL- Works fine, with a new keyboard. No problems.

1050- With Happy mod. Seems to have some trouble on double density, although I have swapped out the drive mech.

2 Rana 1000 drives- These work very well, including double density.

XDM121, I think- The daisy wheel printer. Really nice for word processing, especially with Omniwrite. Works like a dream, with spare (unused) ribbon and daisywheel.

1030- 300 baud modem. I recommend only if you have no other choice, as 300 is so damn slow.

410- Program recorder. Needs a new belt, but can be rigged to work as is.

Enough serial cables and power supplies to run and connect everything at once.

Monitor cable, for the 800.

2 trackballs, the real deal from Wico.

Several joysticks.

An offensively large number of books and magazines (Analog, Antic, Compute, De Re Atari, Technical Reference manual, all kinds of programming and hardware stuff).

Far too many disks to describe. Figure about 100-120. Not all will work, in all likelihood, since many are 10+ years old, but they were readable as of May when my 800 bit it.

Want specifics, or just want it all? Email me.

Thanks,

Harry

This is possible. I know the 6502 has a function heirarchy that
processes the "bits" of an instruction on a per-cycle basis. If this
could be piplined, the 6502 could go REAL 1 cycle RISC. :)

5204. Pictures of old 8-bit Ataris

Newsgroup: comp.sys.atari.8bit
Date: 1994-09-11 21:41:03 UTC
From: ripi@aol.com
Message-ID: <34vthf$ejc@search01.news.aol.com>
Source record: 98502

I happened across an old catalog of 8-bit Ataris, and was wondering if there is enough interest for me to scan the pictures.

I figure 640x480 in 256 colors is sufficient, unless there is greater demand for 24-bit TIFFs in higher resolutions.

I can provide pictures now of the 600XL, 800XL, 1200XL, 1400XL and 1450XLD. I can also dig up pics of various peripherals.

I'm also sure I can find pictures of the 400 and 800 and their peripherals.

So everybody let me know what you'd like to see, what size and so forth. I don't have FTP access, so I may post them here as UUEncoded files. I have access to Delphi, but never have gotten their FTP working well.

5205. Transfer Assistance - Buffalo, NY

Newsgroup: comp.sys.atari.8bit
Date: 1994-09-11 22:41:37 UTC
From: ah818@freenet.buffalo.edu
Message-ID: <CvzLpE.BKu@freenet.buffalo.edu>
Source record: 98478

I've got some Atari software on my PC that I'd like to get onto my 800XL but, als, no way yo make the transfer. I was under the impression that the local Atari 8bit board, the Wizard's Attic, was still up and going, but 2 weeks of trying to hail them only produces a busy signal no matter when I try (eben at 3:00 in the morning). This doesn't appear to bode well for the local 8bit community.

If anyone from Buffalo would be willing to give me a hand or point me to a local users group that miht be able to help me out I'd sure appreciate it. Thanks.

5206. BAD CHECKS FROM UNICORN PUBS.

Newsgroup: comp.sys.atari.8bit
Date: 1994-09-11 23:34:28 UTC
From: b.poehland@genie.geis.com
Message-ID: <199409112334.AA275536445@relay2.geis.com>
Source record: 98473

DISHONORED PAYMENTS FROM WILLIAM & PATRICIA RAYL T/A UNICORN PUBLICATIONS

During the past 10 days I have received a rising tide of complaints & inquiries regarding dishonored checks issued by Unicorn publications & mailed by me, in conjunction with the refund policy described in the April 1994 issue of ATARI CLASSICS Magazine. In view of the increasing seriousness of the matter I feel compelled to quell any rumors spreading on the networks by presenting the facts as I know them.

Of the approximately 350 refunds that were issued, I believe the great majority of them have been paid. At this time it is my impression that fewer than 50 subscribers are affected by the problem.

In the following text, "Unicorn Publications" collectively refers to both William R. Rayl & Patricia L. Snyder-Rayl, who bear all moral & legal responsibility for the situation.

The facts of the matter & the status of the situation are as follows:

1.) During the period Aug.22-Sept.9, 1994, funds in Unicorn's account were drawn down below viability at least twice, for unknown periods of time in each case. During these periods an unknown number of items were dishonored by their bank. I am aware of 6 incidences of fees levied by banks on refund recipients due to NSF checks, plus an additional 5 cases of checks being deliberately witheld from presentation due to fears they would not be honored. I estimate the total number of individuals affected by bad checks could exceed 20.

2.) The reason for the account failures is stupidity amounting to criminal negligence on the part of Unicorn, who apparently wrote checks with wild abandon & failed to keep competent records, even though they were in possession of exact information as to the balance of funds on hand as well as the total cost of refund payments to be issued. This is not the first documented occurrence of Unicorn passing bad checks on the AC account. Problems were experienced in 1992 & again in 1993.

3.) At the present time the account is once again viable, & I am urging all recipients still holding checks to negotiate them at once. Funds from uncashed checks will end up becoming your gift to Unicorn, which they certainly do not deserve.

4.) Despite my requests, Unicorn has failed to account for a further 18 refunds which were to have been handled by them personally, as they had to be processed through credit cards. In view of the deplorable attitudes & unethical behavior exhibited by Unicorn, it is reasonable to assume all the people due credit card refunds have been defrauded.

5.) A Certified Notice was mailed to Unicorn on September 8 informing them of potential criminal liability & advising them of steps to be taken if they wish to avoid felony prosecution. A deadline of September 30 was set for them to resolve all complaints, including complaints for charges incurred from dishonored checks that were subsequently paid when presented a 2nd or 3rd time.

6.) A complaint was filed with the Ann Arbor Police Department on September 9, & a preliminary investigation is now in progress.

7.) I am presently awaiting arrival of complaint forms from the Office of the U.S. Postal Inspector. If Unicorn dishonors the Sept. 30 deadline, a felony complaint of Postal Fraud will be filed. Recipients outside the U.S. who may be defrauded by Unicorn would have to file a complaint with their national postal service, who would likely turn it over to U.S. postal authorities.

8.) Some people have blamed me personally for the bad checks. I wish to make it clear that I never at any time bore any responsibility or authority for financial management of AC's funds, that was entirely Unicorn's responsibility. They bulk-mailed the checks to me, & I served merely as their agent in sending them to individual subscribers. I had no idea which checks were good & which were bad. The perfidious behavior of Unicorn has placed me in an extremely compromising position. Not to mention, I too was nailed with charges from my own bank due to a bad check they passed to me. I officially resigned from AC on August 10, 1994. I am as much a victim- if not more so- as the people who have complained to me.

9.) Unicorn Publications (T/A Pegasus Press) may be contacted by e-mail on CompuServe at: 70007.4640 or via the Internet to Compuserve at: 70007.4640@compuserve.com, or on GEnie at: CONNECT.MAG or via Internet to GEnie at: connect.mag@genie.geis.com. They may also be reached by voice at: 1-313-973-8825, ask for Bill Rayl. Written complaints should be sent to: Unicorn Publications, 3487 Braeburn Circle, Ann Arbor MI 48108. Readers who wish to verify funds may call Bank 1 in Ypsilanti MI at: 1-313-434-7314, ask for Gail Thompson, or call the branch number at: 1-313-572-7800. The number for the Washtenaw County prosecuting attorney's office is: 1-313-994-2380. The number for the Ann Arbor Police Department is: 1-313-994-2661.

10) A defrauded reader in Florida, Vern McColloch, is considering a possible class-action civil lawsuit to recover damages. He may be contacted at: 1-305-792-1942 or in writing: 3721 S.W. 59th Terrace #5, Davie FL 33314-2643.

11) A number of recipients forwarded their refund payments to AC's new publisher, Jim Hood. Jim is aware of the Unicorn problem & is reported to be holding an unknown number of checks. The impact of Unicorn's bad checks upon the new publisher is at present unknown, although some people have expressed fear that Unicorn's bad checks could wreck the renewal of the magazine. That would be tragic for the people who've signed up for the new publication.

12) During the latter half of August when this problem first developed, I was away in Arizona attending the personal needs of my mother who is dying of cancer. I only became aware of it during the first week of September after I returned home & got caught up on my mail. This totally inexcusable situation has thus hit me at a particularly difficult time. In their communications to me on the subject, Unicorn rubs salt in the wound by failing to express any personal culpability for creating the problem or expressing any remorse or regret for the intense distress they have visited upon so many people. The cold-blooded, reptilian attitude exhibited by Mr. & Mrs. Rayl toward the parties they've defrauded is utterly unconscionable.

- Benjamin L. Poehland

5207. Starpath CD project

Newsgroup: comp.sys.atari.8bit
Date: 1994-09-12 00:15:50 UTC
From: krishna@max.tiac.net
Message-ID: <3506jm$88r@sundog.tiac.net>
Source record: 98477

I'm planning on creating a "Complete Starpath/Arcadia" `CD-ROM'
for the Atari 2600. CD-ROM? Well, kinda. The Starpath games were
distributed on tapes, so I'd like to remaster all the tapes (NTSC and
PAL) all onto one CD with some home-brew DTP and the like and sell it at
cost. It's a matter of convenience and preservation that I'm doing
this. We have to do this before the tapes demagnetize or break or
develop too many dropouts.

I have used the "filter" utility in my shell account to preprocess
specific messages depending on the subject header field. I can use it to
build lists of email addresses and I can use simple shell utilities to
count lines and let me know how many people are interested in this or
that. If you would be interested in buying a Starpath CD (Starpath
interface required obviously and assume a price no higher than $20 but
probably lower) then send me email with a subject of CD_LIST. If you have
a well-preserved collection of Starpath tapes you are willing to lend me,
send me a concise list of titles and set the subject to TAPE_DONATE. Then
later on I will decide on "donators" and contact them via email. I will
use the CD_LIST to determine the size of the CD duplication run.

Keep your eyes on rec.games.video.classic for periodic updates.

Thanks.

5208. PAL machines use same peripherals?

Newsgroup: comp.sys.atari.8bit
Date: 1994-09-12 00:49:18 UTC
From: bryedewa@news.delphi.com
Message-ID: <3508ie$75g@news.delphi.com>
Source record: 98479

I noticed that PAL machines use a 3.54 instead of a 3.57 clock. Doesn't this mean that a PAL machine will not be able to use American peripherals since the clock is derived from this crystal?

Besides FTPing to atari.archive.umich.edu, you can try FTPing to
msdos.archive.umich.edu or amiga.archive.umich.edu and just cd'ing to the
Atari/8bit/New directory from there.

You can also always uuencode the upload and mail to
lenn@atari.archive.umich.edu.

Read the FAQ List under "What is INFO-A8?" INFO-A8 is a listserv which redistributes the Info-Atari8 Digest, which in itself is a mail redistribution of comp.sys.atari.8bit postings. The site where INFO-A8 originates archives about a year's worth of INFO-A8's, last time I checked.

Anyone with Internet e-mail can get to the archived collection of INFO-A8 issues. I think that section in the FAQ is geared toward people on BITNET (which used to be where all the listservs were), rather than the Internet. Let me know if you have trouble making the translation.

YES! It sounds like you have the recently-famous catalog with the flying 600XL, 800XL, 1400XL, and 1450XLD on the cover. I really wish I didn't lose mine.

You know what would really be cool? If you scanned everything you could, then coordinated it with one or more of the 8-bit Atari WWW page moderators so they could provide graphics in their offerings. I know at least one was looking for such pictures.

Message-ID: <350jf1$r32@nic-nac.CSU.net>
Source record: 98493

Man, there's probably a LOT of that out there! Heheh.. if you wanted, you could even use a sector editor and hack into a demo (like the one's from Europe) and change the text in the scrollers and you'll have whatever nifty thing is in the background .. in the background.. that make sense.
??

ANYWAYS, or write something simple in TurboBASIC XL like:

```
10 GRAPHICS 15+16:SETCOLOR 0,0,15:POKE 559,35
15 DIM A$(100)
20 A$=" Welcome to my store...."
25 A$(LEN(A$)+1)=" "
30 DO
35 X=X-1
40 IF X<0 THEN X=7
45 IF X=7 THEN Y=Y+1:IF Y>LEN(A$)-48 THEN Y=1
50 TEXT X,32,A$(Y)
55 LOOP
```

oops. ok, that won't work, but it's close.. if you can stand the letters vanishing instantly at the left edge and the screen having a border than just remove the "POKE 559,35" and change "-48" to "-40" and it'll look ok I guess.. a bit small

I must be bored. :) Nevermind that, I know there's quite a bit of scroller software out there for the purpose you stated.. :)

Most Atari peripherals do not care about the clock speed, as they are
connected through the serial bus at 19200 bits per second.

5224. FlickerTerm display

Newsgroup: comp.sys.atari.8bit
Date: 1994-09-12 06:34:48 UTC
From: d.paterson2@genie.geis.com
Message-ID: <199409120634.AA214461673@relay2.geis.com>
Source record: 98504

I've been experimenting with the FlickerTerm display, and have come up with an interrupt (VBI, 23 bytes plus setup routine) which provides a display of 80 columns out of 96. It merely toggles the high byte in the LMS of the display list, then changes HSCROL. I'm looking at writing E: and S: drivers. Has anyone else been experimenting with the FlickerTerm mode? I've tried using the ROM character set (or did I forget to load the FT set ;-) it almost works, and shows a large degree of kerning, which I thought was kind of neat.

Does anyone know of methods to fool the OS when you set up a horizontally scrolling display? Right now, as soon as the HSCROL bit is set in the display list, GR.0 lines take up 48 bytes each. In FT mode, that's an extra 192 bytes for each screen. Added to the 960 bytes/screen of normal GR.0 that's 1152; and for ease of calculation for offsets etc. I use a page boundary, which loses another 128 bytes per screen. I'd like to return to the standard 40 bytes to conserve memory (2 pages), but I don't want to create a d/l with an LMS on every line. If I implement E: and S: handlers I could hide some in those two areas, but I'd rather have a contiguous block. Anyone have any bright ideas?

Dave Paterson

The opinions and ideas expressed herein
are not those of a sane man.

From: jharris@cup.portal.com
Message-ID: <122165@cup.portal.com>
Source record: 98405

> POINT #1 Size of code vs 6502

The 65816, which is the processor I called the most memory efficient, can do your memory move example in 12 bytes, vs 22 for 1802 and 30+ 6502. That's assuming the chip was in 16 bit register mode already, or else you would need 2 bytes to switch into 16 bit mode first, and 2 more bytes to switch to 8 bit mode after the move, if necessary. So 16 bytes max.

> POINT #2 can page zero be considered registers

Registers on other machines are often used for counters, and indirect memory pointers, of which ZP can do both. While I don't call a 6502 a machine with 256+3 registers, I don't usually have major problems doing what I need to accomplish within the confines of the chip. The main thing I run into, is needing to add something when I don't want to trash the A register. The 68000 having 8 data registers is really nice in that regard.

John Harris - jharris@cup.portal.com

I have more partial answers to the memory fetch cycle issues, including one totally unexpected point.

According to a very good hardware designer I know, most CISC chips these days perform a clock divide by two as the very first thing, instantly doubling the length of time the CPU spends doing anything, when comparing to the clock frequency. So a 25MHz 68030 is really operating at 12.5MHz. The reason this apparently takes place, is to get a perfect 50/50 duty cycle on the clock pulses. Since clock ocsillators were apparently not perfectly clean, many chip makers found it difficult to perform all of their timing on the raw clock pulse, and so create their own within the chip.

So this gives a 2 to 1 speed difference compared to the 6502. But the 68000 is 4 times slower, and the additional 2 to 1 factor would appear to be caused by the 6502 utilizing both phases of the clock pulse. The chip does different operations on each half (phase) of the clock pulse, where the 68000 uses only one of the halves.

Okay, so the clock divide by two, and using only half the clock pulse, comes up with the 4 to 1 speed difference of the chip. The only question that remains unanswered, is why don't more chip designers do things the way the 6502 does them. Somewhere, there must be some tradeoffs, difficulties, or drawbacks to the 6502 method, or more designers would be using it.

In the case of the Amiga computer, the half clock phase is put to great use, by designing custom chips that operate on the opposite phase, and can does interleave bus accesses with the 68000 without slowing either chip down. In the Atari8, every time Antic need to access the bus it has to halt the 6502, slowing the system down a bit. It is really nice that the Amiga chips can utilize what would normally be wasted space. While this is a wonderful design, it can't be a typical example, and so there must be more reasons.

John Harris - jharris@cup.portal.com

This sounds really great! I have almost unlimmeted space in my local
ftp directory which also stores some of the documents I provide by ftp and
through the World Wide Web. It would be cool to create a huge catalog
of all Atari 8-bit hardware with pictures and addictional info!
If you scanned them at 640x480 in 256 colors it wouldn't be a problem as
far as disk space is concerned. I would scale them down to an appropriate
size for inclussion in the page itself and when you click on the small
image it'll span an external viewer and show the full picture.
What do ya think?

Cross-posted to: comp.sys.atari.8bit,misc.forsale.computers.other

(This is a re-post, with some items added.)

I have the following complete ATR 8000 system for sale, all for $250 plus shipping. (I will not sell individual parts, because I have no need for a partial system.) Reply by e-mail to ccastn1@oit.gatech.edu.

- Atari 8-bit (choice of 800, 800XL, or 130XE)
- Atari 1050 with US Doubler
- Atari XEP-80
- Atari 830 interface
- Atari 1010 tape drive
- ATR8000 w/64K
- 5.25" and 3.5" high-density drives, in case with power supply
- all cables, power supplies, a joystick, most manuals, lots of software

(I will sell the other two 8-bits for $40 each or $70 for both, plus shipping.)

I need help here. I'm trying to load bigdemo on my XF2 emulator. I haven't got an atari computer, just the XF2 emulator on the PC, and a modem, with which I get bigdemo.

The trouble is that the bigdemo dcm file is 120 Kbytes, which is too much for XF2.

What would you do to play play bigdemo on XF2 if you didn't have an atari?

I know there's an xfd file that represents an empty dual density disk for use with xf2. I found that in xf2's directory. I suspect my question comes down to how do I move the bigdemo.dcm file from DOS into the special empty dual density xfd. Any suggestions?

Thanks
Alex

Hi.. although I don't think BIGDEMO will work on the XF2 (because it's an Atari 400/800 emulator, not an XL/XE emulator), what you need to use to made disks out of DCM files is either:

1) DiskCommunicator 3.2 for the Atari or
2) DCM2DSK for the IBM

DiskCommunicator converts disks to DCMs and vice versa.
DCM2DSK converts DCMs to ATRs for SIO2PC and the XF2. The first beta release is buggy but a new one is coming out as soon as the author can get a copy to UMich. (I can't wait! :))

In a previous article, 74511.1632@CompuServe.COM (Steve Cullen) says:

>Why is the Atari catalog recently famous? By the way, I have
>that one plus the one with the 400/800 in it.

It's sort of a collector's item because it so thoroughly covers the unreleased 1400XL and 1450XLD. I think it came up recently because outside of the publicity photo sent to the magazines, and the different photo in the Best catalog, this Atari product catalog is the only place to get a good look at what these models were to be like.

Source record: 98418

Michael,

I received a copy of a letter sent to Unicorn (Bill & Pattie Rayl, publishers) by Ben Poehland, former AC Managing Editor, regarding this situation today. He is giving them until 9/30 to make ammends to all persons who have received bad checks from them, and if this is not done, legal action by postal authorities and others may be taken.

Just a word of caution...Connect magazine, a telecommunications publication, is being published by the same folks under the company name Pegasus Press. Use extreme caution with this publication right now because the state of the Rayl's financial situation is very unclear right now.

Lawrence Estep
AC Telecomm. Editor

NOTE: All opinions above are my own, and may not necessarily reflect the opinions of other AC staff.

Granted the 65816 is going the right direction, but there's still other features of 15 year old CISC micros that would make them competitive with a 65816 today. Low end device where speed isn't that important but cost is. Memory mapped I/O is a good example. I said the 1802 is limited to only 8 devices on the buss, but the Atari only has 4 devices in it other then Sally. For reading/writting to the PIA you're still going to need a STA $D3XX while an 1802 or 8088 just uses an OUT instruction. I think the OUT on a 8088 may be a 2 byter because of the number of hardware devices they have available, but on an 1802 <foggy memory> I belive the device is encoded in the instructions lower 3 bits. But hey, Western Digital is still alive & you said they only use 255 out of a posible 256 instructions on the 65816? If they really wanted to they could it as a 2 byter & allow 256 devices on the buss while not taking over any RAM/ROM locations for memory mapping. For some strange reason I prefer the memory mapped approach, but I can't give any good reason.
BTW: I haven't done 1802 code in 12 years, but I'd bet with the Store VIA X & DEC the example I gave could go down to 16-18 bytes. But then I loaded immediate #0 twice in the 6502 example so that could've been shortened by a couple of bytes too.

: Hi.. although I don't think BIGDEMO will work on the XF2 (because it's an
: Atari 400/800 emulator, not an XL/XE emulator), what you need to use to made
: disks out of DCM files is either:

: 1) DiskCommunicator 3.2 for the Atari or
: 2) DCM2DSK for the IBM

: DiskCommunicator converts disks to DCMs and vice versa.
: DCM2DSK converts DCMs to ATRs for SIO2PC and the XF2. The first beta release
: is buggy but a new one is coming out as soon as the author can get a copy to
: UMich. (I can't wait! :))

There is a third way that I've used. On UMich there is a program
in the Sio2pc directory named atarimg.exe, an MS-DOS file. It
will make single and enhanced density images that XF2 and SIO2PC
will read... Just but the too-big file in an enhanced image and
you can to the DCM conversion with Diskcomm.

I know some have had trouble with Diskcomm giving error 139 when
trying to format enhanced images under XF2. Don't format! It doesn't
crash on writing like with SIO2PC.

It has worked for me.

5243. Atari 8-bit Omnibus

Newsgroup: comp.sys.atari.8bit
Date: 1994-09-12 22:39:14 UTC
From: d.paterson2@genie.geis.com
Message-ID: <199409122239.AA185009543@relay2.geis.com>
Source record: 98429

Since Atari dropped the 8-bit computer line it's become progressively more difficult to find software and equipment for our Atari 8-bit computers. The days of Antic and Analog issues filled with ads are gone. Many suppliers and software authors can no longer afford to advertise.

Back in April, I decided to try to remedy this. I sent out a mailing to over ninety suppliers, inviting them to send in free ads for "The Atari 8bit

Omnibus". This resource guide will be available for sale beginning October 10th for $5 US, including shipping and handling. Once it's being printed I will release full ordering information.

Right now, I'm offering the same free advertising to the rest of the Atari 8bit community. Free classified ads will be accepted, subject to the following limitations:

(1) Maximum 50 words/ad, two ads per person. Editor decides what constitutes a word. Editor will edit oversize ads.

(2) All ads must pertain to the Atari 8-bit computer line.

(3) All ads must include the advertiser's full name and postal address. Email and phone numbers are a good idea as well.

(4) Advertisers offering software may only offer software originals. Ads offering pirated software will be refused.

(5) Editor and publisher are not responsible for personal losses dues to situations arising from these ads.

(6) Hope nobody was scared off by all this.

(7) Send ads via Email to:
D.PATERSON2@genie.geis.com
Use the message title: Omnibus Ad

Thanks for your support. Watch for the release announcement later this month.

>far as disk space is concerned. I would scale them down to an appropriate
>size...

Okay, I'll provide them in 640x480x256, and if you want, I can send TIFs
at the same size (since that's how they'll originate), so when you scale
them down, they'll still look good.

I figure 99% of all 8-bitters have other machines that they use, so TIFs
shouldn't be a problem for the really picky types. :)

What's the name of your FTP site, and where do you want me to put them?

Rob

It seems I have been having some trouble getting all of my various net services together as of late and as such been suffering some disorganization because of it. Hopefully, that should end as of now, because I have an "official" account at school which should let me handle all the news and mail I want. SO...I have mailed copies of version 0.2 beta to those people I have gotten requests from and I have also mailed it to the atari.archive.umich.edu coordinator, so hopefully it should be widely available.

In other news, I also have a SCOPY -> .DSK converter and a SpartaDOS .DSK reader (handy for moving files from the 8-bit to the PC) in the works. I will see about offering these for public consumption depending on public demand for them.

Jason

5253. Atari 5200

Newsgroup: comp.sys.atari.8bit
Date: 1994-09-13 05:21:45 UTC

Message-ID: <199409130521.AA145803672@relay2.geis.com>
Source record: 98430

I believe that ANALOG Computing had an article on the 5200 in issue 15, which included information on porting software from the 8-bit to the 5200. I don't have the issue any more, but I seem to remember that the chips are the same, except that the mapping into memory was different (especially in the $Dxxx area). The joysticks were different as well.

I remember seeing a Xevious port which was outstanding; best scrolling shoot-em-up I ever had for my Atari.

Hi Atari-Users,

I have got an old 130XE with a 1050-Floppy-Drive standing
unused in the attic because I don't want to hack in the original
Atari BASIC (no ELSE-block in IF, so everything will be a matter of GOTO).
It is a pity not to use the machine.

If someone in Europe has programs, compilers, interpreters or
utilities on 1050-floppies or game-port cartridges for sale,
please contact me by email. I also take them for free :-)
(Europe because of easy payment and shipping)

Thank you for your interest,
Ernst.

The Atari hardware does not allow interrupt driven keyboard input.
The keyboard is polled thru it's matrix looking for a key press by
software (as I recall). All comparasons to_any_ system with
interrupt driven keyboard routines will find the Atari method
lacking ... especially for those of us used to typing ahead.
There is no way for the Atari to know a key is pressed until it
goes to look for it, which makes it easy for the Atari to miss
keys.

5256. MASSIVE AUCTION III

Newsgroup: comp.sys.atari.8bit
Date: 1994-09-13 15:29:49 UTC
From: dw901@cleveland.Freenet.Edu
Message-ID: <354ghd$d3u@usenet.INS.CWRU.Edu>
Source record: 98435

Auction updates will be posted approximately every 24 hours, and bidders
will receive a copy of the update via E-mail at the same time.

PLEASE READ THE AUCTION RULES AT LEAST ONCE BEFORE PLACING BIDS.

NOTE: I will use the first part of your E-mail address when listing bids.

****

Games and/or game systems included in this auction are:

ATARI 2600 ATARI 5200 ATARI 7800 ATARI 8-bit
ATARI LYNX COLECOVISION INTELLIVISION
ODYSSEY2 SEGA MASTER SYSTEM TEXAS INSTRUMENTS TOMY TUTOR
TRS-80 COLOR COMPUTER VECTREX

AUCTION RULES:
1) THE DEADLINE FOR BIDDING IS 11:59 P.M. EST, ON TUESDAY, SEPTEMBER 20TH.

2) MINIMUM BIDS ARE LISTED FOR EACH ITEM UP FOR AUCTION, MINIMUM INCREMENTS
ARE $0.50 ON GAMES AND $1.00 ON SYSTEMS.

3) BUYER PAYS ALL SHIPPING COSTS.

4) NO PACKAGE DEALS ON GAMES OR SYSTEMS.

5) TRADE OFFERS WILL BE ENTERTAINED, BUT CASH OFFERS ARE GIVEN PRIORITY.

6) EVERYTHING IS SOLD AS IS. UNLESS SPECIFIED, ALL GAMES AND SYSTEMS HAVE
BEEN TESTED AND ARE IN WORKING ORDER.

7) IN CASE OF TIES, FIRST BID RECEIVED WINS.

8) IF YOU ARE THE HIGH BIDDER ON AN ITEM, YOU ARE EXPECTED TO BUY THAT
ITEM. PLEASE DON'T BID UNLESS YOU ARE PREPARED TO BUY WHAT YOU BID ON.

9) PAYMENT MUST BE MADE IN U.S. FUNDS, DRAWN FROM A U.S. BANK BRANCH.

NOTE: ALL CARTRIDGES ARE LOOSE (IE. WITHOUT BOX AND MANUAL), UNLESS SPECIFIED.

HARDWARE:

LOT #1 - THERE ARE TWO OF THESE SYSTEMS AVAILABLE, THE TOP 2 BIDS ARE LISTED.

ATARI 2600 SYSTEM (6 SWITCH DESIGN), WITH TWO (2) ATARI JOYSTICKS, POWER SUPPLY, RF SWITCHBOX, AND SEVEN (7) GAMES [NO BOXES, OR MANUALS FOR GAMES]:

ASTEROIDS (Atari)
BERZERK (Atari)
COMBAT (Atari)
DEFENDER (Atari)
MISSILE COMMAND (Atari)
PAC-MAN (Atari)
SPACE INVADERS (Atari)

THESE ARE COMPLETE ATARI 2600 SYSTEMS, NOTHING ELSE NEEDED TO PLAY!

BID #1) MINIMUM OPENING BID OF $25.00
BID #2) MINIMUM OPENING BID OF $25.00

*****

LOT #2 - THERE ARE FOUR OF THESE SYSTEMS AVAILABLE, THE TOP 4 BIDS ARE LISTED.

ATARI 2600 SYSTEM (6 SWITCH DESIGN), WITH TWO (2) ATARI JOYSTICKS, POWER SUPPLY, RF SWITCHBOX, AND SIX (6) GAMES [NO BOXES, OR MANUALS FOR GAMES]:

ASTEROIDS (Atari)
COMBAT (Atari)
DONKEY KONG (Coleco)
E.T. THE EXTRA TERRESTRIAL (Atari)
PAC-MAN (Atari)
SPACE INVADERS (Atari)

THESE ARE COMPLETE ATARI 2600 SYSTEMS, NOTHING ELSE NEEDED TO PLAY!

BID #1) MINIMUM OPENING BID OF $25.00
BID #2) MINIMUM OPENING BID OF $25.00
BID #3) MINIMUM OPENING BID OF $25.00
BID #4) MINIMUM OPENING BID OF $25.00

*****

LOT #3

ATARI 5200 (W/4 JOYSTICK PORTS), ONE ATARI CONTROLLER, ATARI POWER SUPPLY, AND ONE (1) GAME [NO BOX OR MANUAL FOR GAME]:

POLE POSITION

THE CONTROLLER IS WORKING, BUT THE CONTACTS ON THE INSIDE NEED CLEANING PERIODICALLY. I WILL ALSO THROW IN A NON-WORKING CONTROLLER FOR PARTS, FREE.

THERE IS NO RF/POWER SWITCHBOX WITH THIS SYSTEM, BUT I WILL INCLUDE PLANS ON HOW TO BUILD ONE. THE PARTS COST APPROX. $8 AT RADIO SHACK.

MINIMUM OPENING BID OF $25.00

*****

LOT #4

ATARI 400 COMPUTER WITH ONE ATARI JOYSTICK, RF SWITCHBOX, AND PAC-MAN CARTRIDGE.

THIS SYSTEM DOES NOT COME WITH A POWER SUPPLY. THE SPECIFICATIONS FOR THE POWER SUPPLY ARE AS FOLLOWS:

MODEL NO. -- CO 14319 (Atari)
INPUT: 120 VAC, 60 HZ, 18.5 W
OUTPUT: 9 VAC, 15.3 VA

MINIMUM OPENING BID OF $17.50

*****

LOT #5

ATARI 400 COMPUTER WITH ONE ATARI JOYSTICK, RF SWITCHBOX, AND POLE POSITION CARTRIDGE.

THIS SYSTEM DOES NOT COME WITH A POWER SUPPLY. THE SPECIFICATIONS FOR THE POWER SUPPLY ARE AS FOLLOWS:

MODEL NO. -- CO 14319 (Atari)
INPUT: 120 VAC, 60 HZ, 18.5 W
OUTPUT: 9 VAC, 15.3 VA

MINIMUM OPENING BID OF $17.50

*****

LOT #6

COLECOVISION SYSTEM WITH SYSTEM MANUAL, COLECO POWER SUPPLY, COLECO RF SWITCHBOX, TWO (2) CONTROLLERS, AND DONKEY KONG CARTRIDGE (W/MANUAL).

MINIMUM OPENING BID OF $28.00

*****

LOT #7

COLECOVISION EXPANSION MODULE NO. 1: ATARI 2600 CONVERTER (Coleco). PLAY VIRTUALLY ALL ATARI 2600 GAMES ON YOUR COLECOVISION SYSTEM.

MINIMUM OPENING BID OF $20.00

*****

LOT #8

INTELLIVISION II SYSTEM WITH TWO (2) CONTROLLERS, AND RF SWITCHBOX. SYSTEM ALSO COMES WITH FIVE (5) GAMES [TWO OF WHICH HAVE BOX, AND 1 OVERLAY. THE OTHER THREE ARE LOOSE GAMES -- NO BOXES, MANUALS, OR OVERLAYS]:

ASTROSMASH (WITH BOX AND 1 OVERLAY)
NIGHT STALKER (WITH BOX AND 1 OVERLAY)
MAJOR LEAGUE BASEBALL
LAS VEGAS POKER AND BLACKJACK
SEA BATTLE

THERE IS NO POWER SUPPLY WITH THIS SYSTEM. THE SPECIFICATIONS ARE AS FOLLOWS:

MODEL 5872-9629 (Mattel)
INPUT: 120 VAC, 60 HZ, 25 W
OUTPUT: AC 16.7 V, 1 A

MINIMUM OPENING BID OF $25.00

*****

LOT #9

Yes and no. Sparta manages to get around this with "key on" ya know.

I have an ancient copy of Kyan Pascal I bought back in high school, and it never worked worth a damn.

But I've heard that the newest (whatever that is) version works pretty well. If this is true, I'm interested in finding a copy. If you have one, please drop me a line.

Thanks!

Rob

5260. Pinouts Needed

Newsgroup: comp.sys.atari.8bit
Date: 1994-09-14 05:32:08 UTC
From: ripi@aol.com
Message-ID: <3561so$8hn@search01.news.aol.com>
Source record: 98443

I'm trying to use one of Radio Shack's little solder-type jumpber boxes (DB25) to make an adapter to use a modem with an MIO or P:R: Connection...

I have the pinouts in the manual to go from DB9 to DB25, but I don't have the pinouts of a NORMAL one to compare to, or the pinouts (preferably) of what I need to connect in this jumper box (probably all of one wire different) to use it as an adapter.

Does anyone out there have this info?

Rob

>The Atari hardware does not allow interrupt driven keyboard input...

On the contrary, the Atari keyboard interface is IRQ interrupt driven.
I've also done programs which turn off the IRQ's and read the keyboard port
(only one hardware register) on vertical blank, and I use type ahead
buffers with both methods. Missing keys would be a fault of the specific
software program, because the hardware is very capable.

Hi,

Has anyone tried using the ROMCOPY program which comes in the Atariem2.zip package? I tried using it in XF2 (which it claims should work) and although it seems to run with no errors, it doesn't copy anything to the disk image. Help!

Ta, Zargwog...

My company wants nothing to do with my views....probably just as well!

5263. Help - Alternate Reality

Anyone have an idea on the following?

Bought some original game disks from a netter and I'm currently having problems with 2 of the games. AD - the City, and AD - the Dungeon. Both games have the same behavior. After the title screen/intro/char disk initialization is finished I'm eventually queried to insert disk2 side-1..after a short read it ask the same ?..acts as if it's the wrong disk. If I place one of the other disk instead of the correct one the read is very,very short followed by the same message. This leads me to believe it likes something about the correct disk, but eventually rejects it and prompts for action. I'm using a 65XE and have tried 3 diff drives, 2 810's and an indus. A gut feel tell's me that both of these disk are not bad.

Could I be having a compatibility issue with the 65XE?

I've been looking to obtain these 2 games for somtime and was hoping to play them through the fall/winter months ;-)

The doc's for 'the Dungeon' refer to "THe Dungeon Guide"...the seller wasn't familiar with it. Anyone have a copy available?

Ronm

Just goes to show what relying on memory of schematics not looked
at recently will do! Thanks for the correction, and I should have
known Atari would build the function into their custom logic
chips.

I think it is great idea!
I'd like place some Atari photos on my Big Atari 8bit Home Page, but
I didn't get any of them. Unfortunatelly, I haven't too many space on my
disk, so I can't keep all 640x480x256 graphics. However, I'll place them
after scaling down. Mail your pictures to The Gatekeeper, I suggest. I'll get
all of them from your archive and choose some photos to use on my pages.

RIPI, Gatekeeper, what do you think?

5267. Tons of old atari 8 bit stuff 4 sale

Newsgroup: comp.sys.atari.8bit
Date: 1994-09-14 16:27:26 UTC
From: ericson@ucssun1.sdsu.edu
Message-ID: <35789e$r1q@gondor.sdsu.edu>
Source record: 98442

This will be the last posting of all the old atari stuff. AAfter this it
will be going to my nephew for what I am sure will be total destruction.

Now here's the deal; I have several old atari components and a 3
drawer cabinet full of software. I have NO ROOM for this junk and I want
it gone. If you wish to make me an offer leave me mail and DO NOT include
shipping (I had a couple of offers that were so rediculous that they
wouldn't even cover shipping; I will NOT pay to get rid of them.) Nuff said.

The items are:
800 w/ 256k ram upgrade
850 interface w/ modem and printer cables
1050 drive in sparkling condition
Rana 1000 drive
(Believe it or not a Gorilla Banana Printer)
A 3 drawer file of 5.25" disks
And possibly a sparkling 130xe (waiting for a response from someone)

The story goes like this: I liked atari alot, I discovered IBM about 8
months after I bought the 130 and the 1050 so they went into a box, into
a closet in my parents house. I now have them and have vowed to rid
myself of them in less than 30 days (arbitrary #) you can leave me mail
if you are intrested; I check it usually twice daily. I will reply to all
serious offers the same day I get the message. The only exception to this
rule is on the weekends)

Kevin.
ericson@UCSSUN1.sdsu.edu
Flagg on irc
Thank you for your intrest.

I know this isn't exactly what you want, but it _might_ help until
someone gives more info: try the unix "strings" command. Of course,
this won't work if DCM is a compressed format.

>Gremlins and PacMan, feel free to send me a message.

Speaking of porting and hacking, does anyone here know anything about POKEYs? Most of my hacking is involved with Atari's old arcade lineup, and I'm having trouble figuring out how the POKEY chips worked. (POKEY == 40-pin chip marked CO12294-01, often with an AMD logo on it...)

A fellow hacker suggested I check out c.s.a.8bit; apparently there are some 7800 carts which use the same chip, and judging from the porting discussion in progress, there are plenty of people here also enjoy programming in silicon :-)

Does anyone have a list of carts that used this chip (Hey, I may get lucky in a surplus store someday!), and more interestingly, does anyone have any info on how to program/play with these chips?

(If you respond via news, please send me a copy via e-mail; our newsfeed has been a bit spotty recently...)

Thanx in advance,
Doug.

I had the same problem with the disks. Sometimes you can just keep one of the consol keys pressed & read it numerous times, others I'd wait for the disk to spin down a little then press a key before it completely stopped. Really anoying.

5274. INFO-A8 archives

Newsgroup: comp.sys.atari.8bit

Does anyone know if archives of the Info-Atari-8 digest are kept anywhere? I'd like to see about getting back issues, if possible. If not, I would like to see about possibly either starting an archive of my own, or see about keeping them on atari.archive.umich.edu, assuming they have the room.

Any information would be appreciated.

Jason

Victor Parada G. (vparada@inf.utfsm.cl) wrote:
: Please post any answer... I'm trying to extract files from a .DCM
: disk in unix, just to read/print the docs without transfering it to
: a PC and running the emulator, or transfer only the right binary
: to my 8 bit. Of course, I must check the format type of the unDCM
: disk image before process it.

Will do. I really don't want to waste time reverse engineering something
when the information is already available, and there is already utilities
for the IBM (and other platforms) that let you manipulate DCM format images.

I heard that DCM is using RLE for compression, but what is the escape code
and how is the header setup and what does it mean? Oh well.

5277. Wanted: Anyone who's used a MIO w/ a SCSI drive

Newsgroup: comp.sys.atari.8bit

5278. Scrolling Ad Software

Newsgroup: comp.sys.atari.8bit
Date: 1994-09-15 13:12:42 UTC
From: REASERRL@POST2.LAAFB.AF.MIL
Message-ID: <2E7847DC@POST0.LAAFB.AF.MIL>
Source record: 98453

The best program for scrolling ads is Pab Sungenis' Message Board 2000. The program was originally written as a Cable TV menu thing. It was reviewed in Current Notes by Mike Todd, who tested it at a convention, I believe. I think it runs in TurboBASIC (CTH) with SpartaDOS and is shareware.

The ST157N will indeed work with an MIO. He needs to get the HDFMTPH8 or 9 program to format it first.. THEN he can partition.

More than likely, he's using an older HDMFTPHx.com program that isnt really formatting correctly.

I had the same problems with two 180meg SCSI drives..

Source record: 98364

I have got about 30 - 810 disk drives and 25 - 800s that came out of a local school.
I really don't need that many. I will let them go for $20 each, this price includes
shipping. So it is really about $10 + $10 for shipping (from U.S. Mail from Germany).
They are somewhat dirty and have some writting on them, most of which comes off.
But they have been ops checked and they work. I do not have power supplies for
them though.

Message-ID: <01HH54PSYG4Y8ZHMPK@vax.edinboro.edu>
Source record: 98358

To the person having the problems with the SpartaDOS....

I was having the EXACT same problems with my MIO and RAMBO upgraded machine. I discovered that the problem was really in the SDX hardware. There is a support chip on the cart (a PAL or PLA I think) that seems to be flakey on a number of older carts. Did you swap a 4.21 ROM into an older Cart???

The reason I believe that it is the hardware is because I tried another cart. and all of my problems went away. Anyway... The problem only seems to happen with the PBI in use. Try this.... If you have ACTION! or MAC/65 or another language cart, plug it in on top of the SDX cart and see if the symtoms change. If they do, I would highly suspect the SDX to be at fault. Try to find another one to test.

A while back someone with the initials jrd posted a 130xe for sale.
I figured with (26*26*26-1) possible combinations of intials the
chances of two people having the same initials is something like
1 in 17,575 & even if you say 200 people use this newsgroup, that's
still only about 1 in 88. Was that the J. R. Dunning or just someone
with the same initials?
Rick

>I'm trying to help Chris F. Chiesa run a ST157N with a MIO. Does anyone

>know if this is a drive that the MIO won't work with?

Hmmm... not sure you can. My roommate was trying to make a ST138N work with one, and it won't. It's not compatible with 256-byte sectors. They CAN be made to work, but I hear it requires that you send the drive off to some hard drive repair shop to have the master tracks rewritten. Not worth the trouble, IMO. Instead, we've each picked up some old Miniscribe 8425 20-meggers from old Macs that should work just fine (we'll know when they arrive next week).

Rob

5289. 800xl's for sale/trade for 5200's

Newsgroup: comp.sys.atari.8bit

Looking to purchase a copy of Small Business Systems for the Atari 8bit.

Anybody have a copy that they'd like to sell off?

5291. Reference Manual!

Newsgroup: comp.sys.atari.8bit
Date: 1994-09-16 14:53:37 UTC
From: KENDRICK@sonoma.edu
Message-ID: <940916075356.2403067c@sonoma.edu>
Source record: 98366

No WONDER nobody pointed out the ref.manual to me! I guess not many people KNEW about it! (I just got three letters all asking the same thing - where did you get it? can I FTP it or can you email it to me?) :)

I'll re-find my copy (I originally got it from OdaMan The Amiga (the guy from Japan.. I think he's the only c.s.a.8'r from Japan?) who got it from some OTHER people before he even got ahold of his 130xe) a

Once I find my copy I'll put it up on UMICH either ZIPped or ARCd (probably ARCd for people who can't handle ZIP.. I know that I had a little trouble with UnZIP :))

Also I'll see if I can break it up as well and upload a smaller version (for folks with 88k-or-less drives)

HARDWARE:

LOT #1 - THERE ARE TWO OF THESE SYSTEMS AVAILABLE, THE TOP 2 BIDS ARE LISTED.

ATARI 2600 SYSTEM (6 SWITCH DESIGN), WITH TWO (2) ATARI JOYSTICKS, POWER SUPPLY, RF SWITCHBOX, AND SEVEN (7) GAMES [NO BOXES, OR MANUALS FOR GAMES]:

ASTEROIDS (Atari)
BERZERK (Atari)
COMBAT (Atari)
DEFENDER (Atari)
MISSILE COMMAND (Atari)
PAC-MAN (Atari)
SPACE INVADERS (Atari)

THESE ARE COMPLETE ATARI 2600 SYSTEMS, NOTHING ELSE NEEDED TO PLAY!

BID #1) $25.00 mistered
BID #2) $25.00 rra
BID #3) MINIMUM OPENING BID OF $25.00

*****

LOT #2 - THERE ARE FOUR OF THESE SYSTEMS AVAILABLE, THE TOP 4 BIDS ARE LISTED.

ATARI 2600 SYSTEM (6 SWITCH DESIGN), WITH TWO (2) ATARI JOYSTICKS, POWER SUPPLY, RF SWITCHBOX, AND SIX (6) GAMES [NO BOXES, OR MANUALS FOR GAMES]:

ASTEROIDS (Atari)
COMBAT (Atari)
DONKEY KONG (Coleco)
E.T. THE EXTRA TERRESTRIAL (Atari)
PAC-MAN (Atari)
SPACE INVADERS (Atari)

THESE ARE COMPLETE ATARI 2600 SYSTEMS, NOTHING ELSE NEEDED TO PLAY!

BID #1) $25.00 garpoo
BID #2) MINIMUM OPENING BID OF $25.00
BID #3) MINIMUM OPENING BID OF $25.00

*****

LOT #3

ATARI 5200 (W/4 JOYSTICK PORTS), ONE ATARI CONTROLLER, ATARI POWER SUPPLY, AND ONE (1) GAME [NO BOX OR MANUAL FOR GAME]:

POLE POSITION

THE CONTROLLER IS WORKING, BUT THE CONTACTS ON THE INSIDE NEED CLEANING PERIODICALLY. I WILL ALSO THROW IN A NON-WORKING CONTROLLER FOR PARTS, FREE.

THERE IS NO RF/POWER SWITCHBOX WITH THIS SYSTEM, BUT I WILL INCLUDE PLANS ON HOW TO BUILD ONE. THE PARTS COST APPROX. $8 AT RADIO SHACK.

MINIMUM OPENING BID OF $25.00

*****

LOT #4

ATARI 400 COMPUTER WITH ONE ATARI JOYSTICK, RF SWITCHBOX, AND PAC-MAN CARTRIDGE.

THIS SYSTEM DOES NOT COME WITH A POWER SUPPLY. THE SPECIFICATIONS FOR THE POWER SUPPLY ARE AS FOLLOWS:

MODEL NO. -- CO 14319 (Atari)
INPUT: 120 VAC, 60 HZ, 18.5 W
OUTPUT: 9 VAC, 15.3 VA

MINIMUM OPENING BID OF $17.50

*****

LOT #5

ATARI 400 COMPUTER WITH ONE ATARI JOYSTICK, RF SWITCHBOX, AND POLE POSITION CARTRIDGE.

THIS SYSTEM DOES NOT COME WITH A POWER SUPPLY. THE SPECIFICATIONS FOR THE POWER SUPPLY ARE AS FOLLOWS:

MODEL NO. -- CO 14319 (Atari)
INPUT: 120 VAC, 60 HZ, 18.5 W
OUTPUT: 9 VAC, 15.3 VA

MINIMUM OPENING BID OF $17.50

*****

LOT #6

COLECOVISION SYSTEM WITH SYSTEM MANUAL, COLECO POWER SUPPLY, COLECO RF SWITCHBOX, TWO (2) CONTROLLERS, AND DONKEY KONG CARTRIDGE (W/MANUAL).

MINIMUM OPENING BID OF $28.00

*****

LOT #7

COLECOVISION EXPANSION MODULE NO. 1: ATARI 2600 CONVERTER (Coleco). PLAY VIRTUALLY ALL ATARI 2600 GAMES ON YOUR COLECOVISION SYSTEM.

MINIMUM OPENING BID OF $20.00

*****

LOT #8

INTELLIVISION II SYSTEM WITH TWO (2) CONTROLLERS, AND RF SWITCHBOX. SYSTEM ALSO COMES WITH FIVE (5) GAMES [TWO OF WHICH HAVE BOX, AND 1 OVERLAY. THE OTHER THREE ARE LOOSE GAMES -- NO BOXES, MANUALS, OR OVERLAYS]:

ASTROSMASH (WITH BOX AND 1 OVERLAY)
NIGHT STALKER (WITH BOX AND 1 OVERLAY)
MAJOR LEAGUE BASEBALL

LAS VEGAS POKER AND BLACKJACK
SEA BATTLE

THERE IS NO POWER SUPPLY WITH THIS SYSTEM. THE SPECIFICATIONS ARE AS FOLLOWS:

MODEL 5872-9629 (Mattel)
INPUT: 120 VAC, 60 HZ, 25 W
OUTPUT: AC 16.7 V, 1 A

$25.00 kelley

*****

LOT #9

INTELLIVISION II SYSTEM WITH TWO (2) CONTROLLERS, AND RF SWITCHBOX. SYSTEM ALSO COMES WITH FIVE (5) GAMES [TWO OF WHICH HAVE BOX, AND 1 OVERLAY. THE OTHER THREE ARE LOOSE GAMES -- NO BOXES, MANUALS, OR OVERLAYS]:

NIGHT STALKER (WITH BOX AND 1 OVERLAY)
SPACE BATTLE (WITH BOX AND 1 OVERLAY)
BASEBALL (SAME AS MAJOR LEAGUE BASEBALL)
LAS VEGAS POKER AND BLACKJACK
SEA BATTLE

THERE IS NO POWER SUPPLY WITH THIS SYSTEM. THE SPECIFICATIONS ARE AS FOLLOWS:

MODEL 5872-9629 (Mattel)
INPUT: 120 VAC, 60 HZ, 25 W
OUTPUT: AC 16.7 V, 1 A

MINIMUM OPENING BID OF $25.00

*****

LOT #10

INTELLIVISION INTELLIVOICE VOICE SYNTHESIS MODULE

(SEE INTELLIVISION GAME LIST FOR THREE INTELLIVOICE COMPATIBLE GAMES!)

MINIMUM OPENING BID OF $10.00

*****

LOT #11

ODYSSEY2 SYSTEM WITH ORIGINAL RF SWITCHBOX, POWER SUPPLY, AND ONE CARTRIDGE [NO BOX OR MANUAL FOR GAME]:

AJ 9400 - SPEEDWAY! / SPIN-OUT! / CRYPTO-LOGIC!

BOTH CONTROLLERS ARE MISSING THE LITTLE BLACK KNOB OFF THE TOP OF THE JOYSTICK, OTHERWISE EVERYTHING WORKS.

MINIMUM OPENING BID OF $25.00

*****

LOT #12

RADIO SHACK TRS-80 COLOR COMPUTER, WITH BUILT IN BASIC LANGUAGE, AND BUILT
IN POWER SUPPLY. CAN PLAY CARTRIDGE GAMES.

MINIMUM OPENING BID OF $20.00

*****

LOT #13

SEGA MASTER SYSTEM WITH ONE CONTROLLER, *NEW* POWER SUPPLY, RF SWITCHBOX,
AND FOUR (4) GAMES. TWO (2) BUILT-IN GAMES:

HANG-ON
SAFARI HUNT

AND TWO (2) CARTRIDGES:

PENGUIN LAND
SHANGHAI (WITH BOX)

MINIMUM OPENING BID OF $25.00

*****

LOT #14

TEXAS INSTRUMENTS -- TI 99/4A COMPUTER WITH ORIGINAL POWER SUPPLY, ORIGINAL
RF SWITCHBOX, AND FUNCTION KEY STRIP (FOR KEYBOARD).

MINIMUM OPENING BID OF $20.00

In a previous article, ah818@freenet.buffalo.edu (Phillip M. Fries) says:

>I've been looking for forth language packages for the Atari 8bit
>and ran across a very breif reference to an ANTIC forth, or what
>appeared to be such a reference, in an old message posted somewhere.
>Does anyone know if such a creature ever existed? Or where one might
>find it?

I'm pretty sure it's listed in the B&C ComputerVisions catalog. They
bought out all of Antic's commercial offerings a few years ago. Give them
a call.

Last I looked about a year's worth of Info-Atari8 Digests were archived by
the INFO-A8 listserv. You can get INFO-A8 and it's associated files from
the Internet, though I'm afraid it may not be completely obvious how to do
so from my BITNET-oriented description in the FAQ. Give it a shot and let
me know if you run into trouble. Meanwhile I'll update the INFO-A8 section
of the FAQ to be usable by both BITNET and Internet users.

The listserv has about a year's worth on hand, to get a complete list of the
files they have, send a letter to listserv@vm.marist.edu with the line,
INDEX INFO-A8 also, you should send a letter with the line INFO to get
a list of other command available.

betz@numerik.fb6.uni-siegen.de (Ernst A. Betz) wrote:

EB> Hi Atari-Users,
EB>
EB> I have got an old 130XE with a 1050-Floppy-Drive standing
EB> unused in the attic because I don't want to hack in the original ATARI
EB> BASIC (no ELSE-block in IF, so everything will be a matter of GOTO).
EB> It is a pity not to use the machine.

I believe that Frank Ostrowski's public domain "TURBO BASIC" has an IF-THEN-ELSE block structure included in it, and it is designed for European ATARI 8-bits with a 50hz power cycle (has a TIME$ function and everything).

For BASICs that lack an ELSE conditional you can just reverse the nature of the conditional IF test. The "GOTO" is no more out of place than the "ELSE" is. The code size isn't significantly different. The only "strange" thing about the code is that the default "ELSE" case comes above the IF. There was a series of articles in BYTE MAGAZINE showing the programmer how to write top-down structured BASIC programs using unstructured BASICs. I found the series quite helpful. It covered IF-THEN-ELSE, REPEAT-UNTIL, WHILE, CASE, and other familiar block structures and how to implement them in the earlier unstructured BASICs of the late 1970's / early 1980's. The technique used is fairly straight-forward:

```
IF a=8 THEN
PRINT "EIGHT"
ELSE
PRINT "NOT EIGHT"
ENDIF
```

...becomes...

```
IF a<>8
PRINT "NOT EIGHT" :REM ELSE
GOTO 100
PRINT "EIGHT" :REM IF
100 REM ENDIF
```

In this case the "GOTO" isn't "sloppy" as it does the same thing that the "ELSE" does, only in this case the ELSE doesn't reverse the conditional IF test because we have already reversed it at ahead of time at the start of the block. So you --CAN-- use an ELSE block "only with a GOTO". Likewise a WHILE, a CASE, etc. After all, the assembly language

which actually runs the programs only uses GOTOs called jumps and branches (IFs with GOTOs).

P.S. Please forgive me if you know all of this already.

In article <RS5yXZQ.kamaro_kid@delphi.com> kamaro_kid@delphi.com writes:

> SuperVideo provides a cleaner, sharper video image - and allows you to use
> an XL computer on a split video monitor..

My 800XL works fine on a split video monitor as it is. Did you mean
XE, or are European models different from the US ones?

FOR SALE - ATARI 8-BIT SOFTWARE

Get Rich! Insurance Planning (Arrays Software), Megafont II/II+/Font Simulator Package (XLent Software), Winter Challenge $5.00/each or all 3 for $12.50

F-15 Strike Eagle & Silent Service (Microprose) $5 each

FOR SALE - ATARI 2600 CARTS

Realsports Football $3

FOR SALE - ATARI 7800 CARTS

Ballblazer, Karateka, Pole Position II
$4 each

Karateka (cart only) $3

FOR SALE - COMMODORE 64/128 SOFTWARE

Dave Winfield's Batter Up! (Avant-Garde) $6.00
Candy Land (Gametek) $5.00
Fisher Price: Firehouse Rescue, Little People Bowling Alley, My Grand Piano, School Bus Driver $5.00 each
Shark Attack! (Greg Norman's Golf Simulator) (Virgin Software) $7.50
Pocket Planner 2 Spreadsheet, Pocket Filer 128/64 (Digital Solutions), The Filer (Spinnaker) $3.00 each
Bop 'N Rumble (Mindscape) $5.00
F-15 Strike Eagle (Microprose) $5.00

USED: Professional Gambler (Load & Go) $2.50, Star Rank Boxing (Gamestar) $3.00

SPECIAL OFFER: Purchase all of the Commodore 64/128 software for only $50

All items are brand new in original boxes unless noted.

All prices include shipping. Multiple quantities may be available for some 2600/7800 titles. If interested, contact Lawrence Estep at 71450,1050 on CompuServe or 71450.1050@COMPUSERVE.COM on Internet.

5311. BUNCH O JOYSTICKS AND TRACKBALL FOR SALE!!

Newsgroup: comp.sys.atari.8bit
Date: 1994-09-17 22:51:01 UTC
From: chipdancer@aol.com
Message-ID: <35frsl$m9n@newsbf01.news.aol.com>
Source record: 98395

I am selling a big box full of joysticks including:
Wico Trackball (great for Missle Command and Centipede)
Power Stick (2)
Suncom Slik Stick
Wico Boss
Mindscape Power Player
Wico Command Control with metal shaft
Atari paddles
Kraft square beige (2)
Epyx 500XJ ergonomic grip
Wico rubberized ergonomic grip
generic no-name
Misc 800 cables and connectors
Databyte power supply 9v 3.4 amp

So that's 10 joysticks, a trackball, paddles and misc junk. I would like
to sell it all together. If you're interested, please make me an offer.
Email directly to:
dginbey@mail.tea.texas.gov and if that doesn't work try:
dginbey@tenet.edu

: XE, or are European models different from the US ones?

No it doesn't. Not unless it was already hacked or you are mistakenly
using the composite line for chroma.

>Yeah, but you could always contact John Harris since that's his bread and
>butter.

I already wrote to the poster, but assume my product is not what he is after, and is quite expensive. I also don't normally sell just the software by itself, since it's designed on a board that fits inside the machine.

Okay, the vote seems to be in, and I will begin scanning the pictures this week. I hope to start posting them by next weekend, possibly sooner. I will more than likely post them on Delphi, and their 8-bit sysop will post them on an FTP site.

I will upload 640x480 GIFs and TIFs of each pic (or a suitable similar size if 640x480 turns out to be too large).

Rob

5318. Macintosh to Atari Classic file transfer

Newsgroup: comp.sys.atari.8bit
Date: 1994-09-18 17:43:21 UTC
From: nthewarapp@ea.com
Message-ID: <nthewarapp-1809941843210001@nthewarapperuma.ea.com>
Source record: 98402

My first post in this newsgroup! -- it's been interesting reading the articles posted here over the past few weeks.

I just moved house and took all my old computers down from the attic; I've got 9....I still don't want to get rid of any!

After all these years my Atari 800XL is still my favourite....it was the one I really used a lot, for games, programming, everything really.

Now I have the room to set it up in my new place, I want to transfer some files from the Internet to my Atari Classic and get it in use again.

At work I have a Macintosh wired to Internet via the company network.
I don't have a serial interface to my Atari, so I'm considering purchasing one so I can send files downloaded on my Macintosh to my Atari.

I have access to every type of computer, all of which are networked at work, and it seems like the most popular methods of transferring files to the Atari are IBM PC based.

I tried the "UTIL" program to transfer files from IBM PC 360k 5 1/4" disk to the Atari, but couldn't get it to work (v1.1.5) -- I tried over a dozen different PCs, including an old XT dug up because it had a 360k only drive (not 1.2M, as I'd heard UTIL only worked on 360k-only drives). No joy.

The program formatted the disk on the IBM OK, and appeared to transfer files to the disk from the IBM PC OK, but all the files had only 1 sector in them, and the Atari wouldn't read the disk.

Any more hints from anyone? -- using "UTIL" would be logistically easier than buying an Atari serial interface, IF I could get it to work.
We've got so many PCs here, even the brand of PC and/or OEM floppy drive that "UTIL" works on would be useful to know.

If that doesn't work...and I'm close to giving up, I'll use a null modem serial transfer from Mac to Atari.

Having read the Atari 8-bit FAQ, I know there are the following serial interfaces available:

* 850 Interface Module
* P:R:Connection
* Multi I/O {can do over 9600 baud}
* Black Box (by Computer Software Services) {can do over 9600 baud }

So my main question is, which would you recommend; for price, availability and functionality?

I only really need the serial port - it would be nice to transfer files at
19,200 baud, but I don't think it's a must.

The most important part right now is availability....as I'm itchin' to use
my Atari again.
I have no idea where to look to buy one; can you recommend a supplier?
If at all possible, I'd like to purchase from a UK supplier, but if not,
then I could order from the U.S. via my company's U.S. office.

Thanks for any help you can provide.

Neil

5321. TurboBASIC XL time fix

Newsgroup: comp.sys.atari.8bit
Date: 1994-09-18 18:19:27 UTC
From: ud264@freenet.Victoria.BC.CA
Message-ID: <1994Sep18.181927.7000@freenet.victoria.bc.ca>
Source record: 98404

Subject: TurboBASIC XL time fix

In article #19989, Douglas E. Goudie asked about the NTSC time fix for
TurboBASIC XL.

Douglas,

The following three programs will fix all known versions of Turbo BASIC
and RUNTIME.COM for NTSC time (if I could get enthusiastic about BASIC
I might consider combining them into one). With the 800 version (aka
FROST BASIC) you must boot the Turbo disk as the BASIC is part of
"DOS.SYS". The other versions simply require some version of Turbo to
run.

Enjoy,

John Picken
Victoria, Canada

5323. MASSIVE AUCTION III - UPDATE #4 (includes lots of Atari)

Newsgroup: comp.sys.atari.8bit
Date: 1994-09-18 23:39:57 UTC
From: dw901@cleveland.Freenet.Edu
Message-ID: <35ij4d$p22@usenet.INS.CWRU.Edu>
Source record: 98305

AUCTION UPDATE #4:

Auction updates will be posted approximately every 24 hours, and bidders
will receive a copy of the update via E-mail at the same time.

PLEASE READ THE AUCTION RULES AT LEAST ONCE BEFORE PLACING BIDS.

NOTE: I will use the first part of your E-mail address when listing bids.

****

Games and/or game systems included in this auction are:

ATARI 2600 ATARI 5200 ATARI 7800 ATARI 8-bit
ATARI LYNX COLECOVISION INTELLIVISION
ODYSSEY2 SEGA MASTER SYSTEM TEXAS INSTRUMENTS TOMY TUTOR

Thanks for the info, I never heard of these upgrades, where do you get info
on them? Are they available for 800's also?
Ben Corr
(bjcorr@delphi.com)

5325. Re: Antic/Analog magazines wanted:

Newsgroup: comp.sys.atari.8bit
Date: 1994-09-19 01:25:21 UTC

Just as a follow-up to my request for Antic and Analog magazines:

I already have duplicates of several issues.. I only need the specific
issues listed.

Thanks.

Hi, ATARI freaks!!

I am planning start machine language programming on Atari now.
I got A65 from UMICH already.

I think 6502 si very similler to 6809, does 6502 have same
commands as 6809??
And let me know nice editor you are using. I got TextPro too,
and I tried it. It has 40 columns, if there is 80 columns editor,
let me know.
Or is it better than coding on Atari to code on PC or other
machine??

Thanks dor your reading!!

I'm interested in the 600XL but am only willing to give $15 (that includes the shipping costs) for it. Typically 600XLs go for around $5 to $10 here.

Hi,

During the weekend I recieved two Atari 800 xl's and two 1050 atari diskdrives, I don't know anything about these stuff but did manage to get it working.

I do not know how old they are but the are working..
I would like to ask all you intelegent life out there for some answers to a few of my questions, here they are !!!

1. There is 2 io ports on the disk dirves, which one do I use ?
2. On what voltage does the drive operate ? (I didn't recieve the PSU)
3. What does the 'drive select' swtich do ?
4. What type of disks does the drive use ?
5. What type of carridges does the computer use ?
6. How can one interface the disk drive with the computer ? (I didn't receive any cables)
7. What is the parallel bus connection for ?
8. How much memory does the machine have ?
9. A pinout of the IO cable would be appreciated.
10. Pinouts of the Monitor/Power connection ?

Thanx,
Carl

PS: I'm A PC man ..... Just checking out these ATARI's for fun ....

5329. Pinouts of 800 XL ???

Newsgroup: comp.sys.atari.8bit
Date: 1994-09-19 12:42:20 UTC
From: tvdm@urix5.uni-muenster.de
Message-ID: <35k0vc$oep@urix5.uni-muenster.de>
Source record: 98309

Hello, i've just got an old and used 800 XL.
I got also a tape-recorder "Phonemark" from someone else.
It seems to fit to the Atari 800 XL, but i dont want to destroy my 800XL,
because the tape-recorder (looks a little like the CBM-Datasette)
is from Phonemark and not from Atari themselves.

Does anyone have technical Specifications of the 800 XL, e.g:
pinout-descriptions,schematics of the hardware .... and is able too mail
them to me?

Thank you and ,please, excuse my bad english

Timm von der Mehden tvdm@math.uni-muenster.de

Try telenet to the Cleveland Freenet. Not sure what its ID is, but it can usually be found on most gophers of any sig nificance. Sometimes its a bit hard to get through because of use.

Once you get on type "go atari". You'kll find yourself in an Atari SIG and I believe under the 8bit menu selection you'll find a technical reference manual for the Atari 400/800/800xl. All kins of good information there ala your enquiry. If you want a copy of it all you'll probably have to run the 15 chapers or so through to your session log file. At least that's what I had to do.

|> No it doesn't. Not unless it was already hacked or you are mistakenly
|> using the composite line for chroma.
|>

Reading this reminds me of what a local 8-bitter found. His 800XL worked
fine with a Comm. 1702 monitor with a cable he bought from Sears. We
found this cable doing just that: sending composite video as chroma.
We did the AC "Super Video" upgrade, and the quality improved tremendously.
The color fringing on GR.0 text screens vanishes (as does artifacting with
GR.8), and readability of letters "M" and "W" improves.

So the point is: your split video monitor being driven by a stock 800XL is
probably giving you no more quality than a non-split video monitor. Do
the Super Video upgrade and change your cable to match the correct pins
coming out for luma/chroma.

It was actually the PD Fig-Forth; Antic sold it as part of their PD
collection. I think it's on the archive.

I am wondering whether there exist a group dedicated to Commodore
64? I've scanned the group names but there is nothing with 'commodore' or
c64 in the name; at the same time the other 8bit computers seemed to be
covered. Any ideas?
Thanx in advance.
Kathleen

5335. Atari games for sale

Newsgroup: comp.sys.atari.8bit
Date: 1994-09-19 17:58:36 UTC
From: stuarts@empress.gvg.tek.com
Message-ID: <35kjgc$hkb@gv-gate.gvg.tek.com>

I have a very worn copy of the schematic for the 800xl. If you can't find something for the European 800xl I could mail a copy of it to you. It's the North American version of the schematic, but it's fairly accurate for all versions.
Rick

I got the 800XL field service manual from Page 6 in the UK, it has all
of the above. You should be able to find their address/phone# in the
FAQ/developer list (sorry, I don't have it at hand right now).

HARDWARE:

LOT #1 - THERE ARE 3 OF THESE SYSTEMS AVAILABLE, THE TOP 3 BIDS ARE LISTED.

ATARI 2600 SYSTEM (6 SWITCH DESIGN), WITH TWO (2) ATARI JOYSTICKS, POWER SUPPLY, RF SWITCHBOX, AND SEVEN (7) GAMES [NO BOXES, OR MANUALS FOR GAMES]:

ASTEROIDS (Atari)
BERZERK (Atari)
COMBAT (Atari)
DEFENDER (Atari)
MISSILE COMMAND (Atari)
PAC-MAN (Atari)
SPACE INVADERS (Atari)

THESE ARE COMPLETE ATARI 2600 SYSTEMS, NOTHING ELSE NEEDED TO PLAY!

BID #1) $35.00 sfoiles
BID #2) $25.00 mistered
BID #3) $25.00 rra

*****

LOT #2 - THERE ARE 3 OF THESE SYSTEMS AVAILABLE, THE TOP 3 BIDS ARE LISTED.

ATARI 2600 SYSTEM (6 SWITCH DESIGN), WITH TWO (2) ATARI JOYSTICKS, POWER SUPPLY, RF SWITCHBOX, AND SIX (6) GAMES [NO BOXES, OR MANUALS FOR GAMES]:

ASTEROIDS (Atari)
COMBAT (Atari)
DONKEY KONG (Coleco)
E.T. THE EXTRA TERRESTRIAL (Atari)
PAC-MAN (Atari)
SPACE INVADERS (Atari)

THESE ARE COMPLETE ATARI 2600 SYSTEMS, NOTHING ELSE NEEDED TO PLAY!

BID #1) $25.00 garpoo
BID #2) $25.00 rhino
BID #3) MINIMUM OPENING BID OF $25.00

*****

LOT #3

ATARI 5200 (W/4 JOYSTICK PORTS), ONE ATARI CONTROLLER, ATARI POWER SUPPLY, AND ONE (1) GAME [NO BOX OR MANUAL FOR GAME]:

POLE POSITION

THE CONTROLLER IS WORKING, BUT THE CONTACTS ON THE INSIDE NEED CLEANING PERIODICALLY. I WILL ALSO THROW IN A NON-WORKING CONTROLLER FOR PARTS, FREE.

THERE IS NO RF/POWER SWITCHBOX WITH THIS SYSTEM, BUT I WILL INCLUDE PLANS ON HOW TO BUILD ONE. THE PARTS COST APPROX. $8 AT RADIO SHACK.

$25.00 marison

*****

LOT #4

ATARI 400 COMPUTER WITH ONE ATARI JOYSTICK, RF SWITCHBOX, AND PAC-MAN CARTRIDGE.

THIS SYSTEM DOES NOT COME WITH A POWER SUPPLY. THE SPECIFICATIONS FOR THE POWER SUPPLY ARE AS FOLLOWS:

MODEL NO. -- CO 14319 (Atari)
INPUT: 120 VAC, 60 HZ, 18.5 W
OUTPUT: 9 VAC, 15.3 VA

MINIMUM OPENING BID OF $17.50

*****

LOT #5

ATARI 400 COMPUTER WITH ONE ATARI JOYSTICK, RF SWITCHBOX, AND POLE POSITION CARTRIDGE.

THIS SYSTEM DOES NOT COME WITH A POWER SUPPLY. THE SPECIFICATIONS FOR THE POWER SUPPLY ARE AS FOLLOWS:

MODEL NO. -- CO 14319 (Atari)
INPUT: 120 VAC, 60 HZ, 18.5 W
OUTPUT: 9 VAC, 15.3 VA

$17.50 sfoiles

*****

LOT #6

COLECOVISION SYSTEM WITH SYSTEM MANUAL, COLECO POWER SUPPLY, COLECO RF SWITCHBOX, TWO (2) CONTROLLERS, AND DONKEY KONG CARTRIDGE (W/MANUAL).

$28.00 bsulliv

*****

LOT #7

COLECOVISION EXPANSION MODULE NO. 1: ATARI 2600 CONVERTER (Coleco). PLAY VIRTUALLY ALL ATARI 2600 GAMES ON YOUR COLECOVISION SYSTEM.

MINIMUM OPENING BID OF $20.00

*****

LOT #8

INTELLIVISION II SYSTEM WITH TWO (2) CONTROLLERS, AND RF SWITCHBOX. SYSTEM ALSO COMES WITH FIVE (5) GAMES [TWO OF WHICH HAVE BOX, AND 1 OVERLAY. THE OTHER THREE ARE LOOSE GAMES -- NO BOXES, MANUALS, OR OVERLAYS]:

ASTROSMASH (WITH BOX AND 1 OVERLAY)
NIGHT STALKER (WITH BOX AND 1 OVERLAY)
MAJOR LEAGUE BASEBALL
LAS VEGAS POKER AND BLACKJACK
SEA BATTLE

THERE IS NO POWER SUPPLY WITH THIS SYSTEM. THE SPECIFICATIONS ARE AS FOLLOWS:

MODEL 5872-9629 (Mattel)
INPUT: 120 VAC, 60 HZ, 25 W
OUTPUT: AC 16.7 V, 1 A

$25.00 kelley

*****

LOT #9

INTELLIVISION II SYSTEM WITH TWO (2) CONTROLLERS, AND RF SWITCHBOX. SYSTEM ALSO COMES WITH FIVE (5) GAMES [TWO OF WHICH HAVE BOX, AND 1 OVERLAY. THE OTHER THREE ARE LOOSE GAMES -- NO BOXES, MANUALS, OR OVERLAYS]:

NIGHT STALKER (WITH BOX AND 1 OVERLAY)
SPACE BATTLE (WITH BOX AND 1 OVERLAY)
BASEBALL (SAME AS MAJOR LEAGUE BASEBALL)
LAS VEGAS POKER AND BLACKJACK
SEA BATTLE

THERE IS NO POWER SUPPLY WITH THIS SYSTEM. THE SPECIFICATIONS ARE AS FOLLOWS:

MODEL 5872-9629 (Mattel)
INPUT: 120 VAC, 60 HZ, 25 W
OUTPUT: AC 16.7 V, 1 A

$25.00 reed

*****

LOT #10

INTELLIVISION INTELLIVOICE VOICE SYNTHESIS MODULE

(SEE INTELLIVISION GAME LIST FOR THREE INTELLIVOICE COMPATIBLE GAMES!)

MINIMUM OPENING BID OF $10.00

*****

LOT #11

ODYSSEY2 SYSTEM WITH ORIGINAL RF SWITCHBOX, POWER SUPPLY, AND ONE CARTRIDGE
[NO BOX OR MANUAL FOR GAME]:

AJ 9400 - SPEEDWAY! / SPIN-OUT! / CRYPTO-LOGIC!

BOTH CONTROLLERS ARE MISSING THE LITTLE BLACK KNOB OFF THE TOP OF THE
JOYSTICK, OTHERWISE EVERYTHING WORKS.

MINIMUM OPENING BID OF $25.00

*****

LOT #12

RADIO SHACK TRS-80 COLOR COMPUTER, WITH BUILTIN BASIC LANGUAGE, AND BUILT
IN POWER SUPPLY. CAN PLAY CARTRIDGE GAMES.

MINIMUM OPENING BID OF $20.00

*****

LOT #13

SEGA MASTER SYSTEM WITH ONE CONTROLLER, *NEW* POWER SUPPLY, RF SWITCHBOX,
AND FOUR (4) GAMES. TWO (2) BUILT-IN GAMES:

HANG-ON
SAFARI HUNT

AND TWO (2) CARTRIDGES:

PENGUIN LAND
SHANGHAI (WITH BOX)

$26.00 strife

NOTE: trade negotiations are in progress for this item, but I'm still
going to accept bids, in case the trade doesn't go thru.

*****

LOT #14

TEXAS INSTRUMENTS -- TI 99/4A COMPUTER WITH ORIGINAL POWER SUPPLY, ORIGINAL
RF SWITCHBOX, AND FUNCTION KEY STRIP (FOR KEYBOARD).

$20.00 tom

5339. Video upgrades

Newsgroup: comp.sys.atari.8bit
Date: 1994-09-19 23:46:26 UTC
From: krishna@max.tiac.net
Message-ID: <35l7si$9ri@sundog.tiac.net>
Source record: 98320

It should also be noted that the XL/XEs are the only ones that NEED video upgrades. The 800 has fine video and all signals are supported. I don't know how clean or dirty the 800's audio is. There was a hack for adding a monitor output for the 400, pretty sure it only has RF which sux.

5340. Re: Macintosh to Atari Classic file transfer

>The program formatted the disk on the IBM OK, and appeared to transfer
>files to the disk from the IBM PC OK, but all the files had only 1 sector
>in them, and the Atari wouldn't read the disk.

I had a similar experience with one of the PC "Atari readers" about two years ago.. My Indus GT having gone to meet its maker years ago, I had a bunch of double density disks that I couldn't read on the Atari side. I read off a bunch of files (most of them binary) and transferred them back to the Atari using a couple of 1200 baud modems hooked together (all I had handy). It did OK with recovering the text files, but none of the binaries worked. Looking at them with a sector editor, I had the sneaking suspicion that the IBM was goofing up in not discarding the last three bytes of each sector-- the length and pointer bytes-- before assembling the sectors into a new chain to be written to the PC hard drive. It could be a coincidence, but each file gained 3 bytes per sector.

>
>If that doesn't work...and I'm close to giving up, I'll use a null modem
>serial transfer from Mac to Atari.

Anyone who's had luck with this, I'd love to hear advice. I still have tons of Paperclip text files I'd like to transfer to my Mac. (And anyone who could post or mail either a list of the ATASCII codes for underline, italic, etc. in a Paperclip file, or a filter/Apple File Exchange module for the same would earn my eternal gratitude).

> >
>Having read the Atari 8-bit FAQ, I know there are the following serial

>
>* 850 Interface Module
>* P:R:Connection
>* Multi I/O {can do over 9600 baud}
>* Black Box (by Computer Software Services) {can do over 9600 baud }

As I recall, the P:R:Connection can also do 19200 baud. I dimly remember hacking a copy of AMODEM to obtain it. As I recall, the standard Atari R: driver reserved *two* different byte values for 9600 baud. Using the P:R: Connection R: driver, the higher "9600" call would actually give you 19.2. Whether an unmodified Atari could handle receiving I/O at 19.2, I have no idea, though. (Yes, I know that the SIO theoretically did 19.2bps operation when dealing with a disk drive, but in practice with DOS 2.0 or 2.5, you were lucky to get throughput of half that. Maybe I'm completely wrong-- I have no idea how Synchromesh or a modded 1050 got improved speed, not being much of a hardware person.)

>
>I only really need the serial port - it would be nice to transfer files at
>19,200 baud, but I don't think it's a must.

Considering that you could transfer a full 180K disk in something like 10 seconds at 19.2....:)

If the tape recorder has a 13-pin connector like the one on the 800XL, I don't know of anything other than Atari-compatible equipment which uses that particular kind of connector.

Try comp.sys.cbm as in Commadore Business Machines. Be forwarned though, they differ from most news groups in that instead of a couple of threads with dozens of relpies (relavant & irrelavant) they seem to consist mostly of single posts for questions that go unanswered.
Rick

Lionel Ginzburg (lginzb@ccat.sas.upenn.edu) wrote:

: seconds at 19.2....:)

Uh, no. 19.2k baud per second (which for the purpose of this discussion let's assume means bits per second) NOT bytes per second. If it were 19.2K bytes per second then yes, transferring 180K would take a little less than 10 seconds at 19,000 CPS. But even 14.4 baud modems with data compression can't do that much I don't think.

For the purpose of data, the theoretical limit is 56K baud off the SIO. The main problem with RS232 (let's assume a buffered UART hanging off the SIO like an R:P: would be) is the overhead in the RS232 handler as serviced by a 1.79mhz processor. It still has to move bytes in and out of SIO and therefore your practical limit is somehwere between 1400 CPS.

It can, however, manage to drive MIDI at the full 31.x baud rate which is pretty impressive.

It's the software/clock speed that's the problem. That's why sloppy term/BBS code from not so long ago couldn't even do 2400 sometimes. It takes very optimized code to do high-speed RS232 on the Atari and at this time it's just barely keeping up at an acceptable rate with 14.4k modems which is a miracle.

5348. MASSIVE AUCTION III - LAST UPDATE (includes lots of Atari)

Newsgroup: comp.sys.atari.8bit
Date: 1994-09-20 15:14:24 UTC
From: dw901@cleveland.Freenet.Edu
Message-ID: <35mu8g$129@usenet.INS.CWRU.Edu>
Source record: 98330

AUCTION UPDATE #6 -- LAST UPDATE (S.T. you can relax now!):

NOTE: this is the LAST UPDATE for MASSIVE AUCTION III, place all bids accordingly. There will be no more posted or e-mailed updates for this auction. This last bidding period will last until 11:59 p.m. EST, on Tuesday, 9/20/94. PLEASE DO NOT SEND BIDS AFTER THAT TIME, AS THEY WILL NOT BE ACCEPTED.

If you are a high bidder in the auction, then you will receive e-mail from me telling you what items you were the high bidder on. If you don't receive e-mail from me by Wednesday night, you were not a high bidder. I won't post the final bids, since I feel that the sale price is private, between myself and the high bidder.

To facilitate the process of getting the items to the high bidders, I would ask that everyone who has a current high bid, and anyone placing them in response to this post, send me your complete postal mail address, so that I may send you an estimated shipping cost along with the high bid notification. Some of you have already sent your address, but I ask you to please send it again, so I don't have to go thru all the old mail.

Thanks to all who participated in this auction!

Mike

***

PLEASE READ THE AUCTION RULES AT LEAST ONCE BEFORE PLACING BIDS.

NOTE: I will use the first part of your E-mail address when listing bids.

****

Games and/or game systems included in this auction are:

ATARI 2600 ATARI 5200 ATARI 7800 ATARI 8-bit
ATARI LYNX COLECOVISION INTELLIVISION
ODYSSEY2 SEGA MASTER SYSTEM TEXAS INSTRUMENTS TOMY TUTOR
TRS-80 COLOR COMPUTER VECTREX

AUCTION RULES:
1) THE DEADLINE FOR BIDDING IS 11:59 P.M. EST, ON TUESDAY, SEPTEMBER 20TH.

2) MINIMUM BIDS ARE LISTED FOR EACH ITEM UP FOR AUCTION, MINIMUM INCREMENTS ARE $0.50 ON GAMES AND $1.00 ON SYSTEMS.

3) BUYER PAYS ALL SHIPPING COSTS.

4) NO PACKAGE DEALS ON GAMES OR SYSTEMS.

5) TRADE OFFERS WILL BE ENTERTAINED, BUT CASH OFFERS ARE GIVEN PRIORITY.

6) EVERYTHING IS SOLD AS IS. UNLESS SPECIFIED, ALL GAMES AND SYSTEMS HAVE
BEEN TESTED AND ARE IN WORKING ORDER.

7) IN CASE OF TIES, FIRST BID RECEIVED WINS.

8) IF YOU ARE THE HIGH BIDDER ON AN ITEM, YOU ARE EXPECTED TO BUY THAT
ITEM. PLEASE DON'T BID UNLESS YOU ARE PREPARED TO BUY WHAT YOU BID ON.

9) PAYMENT MUST BE MADE IN U.S. FUNDS, DRAWN FROM A U.S. BANK BRANCH.

NOTE: ALL CARTRIDGES ARE LOOSE (IE. WITHOUT BOX AND MANUAL), UNLESS SPECIFIED.

In a previous article, nthewarapp@ea.com (Neil Thewarapperuma) says:

>I tried the "UTIL" program to transfer files from IBM PC 360k 5 1/4" disk
>to the Atari, but couldn't get it to work (v1.1.5) -- I tried over a dozen
>different PCs, including an old XT dug up because it had a 360k only drive
>(not 1.2M, as I'd heard UTIL only worked on 360k-only drives). No joy.
>
>The program formatted the disk on the IBM OK, and appeared to transfer
>files to the disk from the IBM PC OK, but all the files had only 1 sector
>in them, and the Atari wouldn't read the disk.

It sounds a lot like you're forgetting to use the binary flag. Would this
be possible?

You also mention the Atari wouldn't read the disk. I've found I have
better chances of success when I format the disk with the Atari first,
then use MyUTIL on the PC to make the transfers. This way you should at
least know you can read the disk both with the Atari and with MyUTIL.

Hope this helps,

In a previous article, s9311912@jupiter.up.ac.za () says:

>1. There is 2 io ports on the disk dirves, which one do I use ?

Either one, they're identical. It's a daisy-chain system, so if you obtain
a second disk drive you'll connect it to your first drive rather than the
(already occupied) port on the computer.

>2. On what voltage does the drive operate ? (I didn't recieve the PSU)

9 V AC, about 31 watts is good.

>3. What does the 'drive select' swtich do ?

It selects whether this will act as Drive 1, Drive 2, 3, or 4 in your
system. With one drive, you need it selected to be Drive 1.

>4. What type of disks does the drive use ?

Single Sided, Single or Double Density. 128K. Must be formatted by or for
the Atari.

>5. What type of carridges does the computer use ?

Cartridges specifically for the Atari.

>6. How can one interface the disk drive with the computer ? (I didn't
>receive any cables)

You just need an SIO cable (unique to the Atari).

>7. What is the parallel bus connection for ?

A few advanced products use it, such as the Black Box from CSS and the
Multi I/O from FTe.

>8. How much memory does the machine have ?

They came with 64K.

>9. A pinout of the IO cable would be appreciated.
>10. Pinouts of the Monitor/Power connection ?

Both provided in the FAQ List, which I could mail to you if you'd like.

OdaMan the AMIGA <odaman@pfu.fujitsu.co.jp> wrote:
> I think 6502 si very similler to 6809, does 6502 have same
>commands as 6809??

There are many similarities, but the 6502 lacks a lot of what the 6809
has. 6809 has a multiplication instruction and two separate stacks,
for examlple, while the 6502 doesn't have the MUL, and has only one
stack.
I hate to say this here, but I think the 6809 is easier to program
than the 6502. Whether that makes it better or not is up to your
personal preference, though.

> And let me know nice editor you are using. I got TextPro too,
>and I tried it. It has 40 columns, if there is 80 columns editor,
>let me know.

I like the Action editor best. I think there's a separate, disk-based
version around somewhere, but I don't remember what it's called. It
fakes 80 columns (or more) with horizontal scrolling.

5353. Re: Help -- ATARI 800 XL and 1050 diskdrive.

Newsgroup: comp.sys.atari.8bit
Date: 1994-09-20 18:12:08 UTC
From: cmwagner@gate.net
Message-ID: <35n8lo$18gg@tequesta.gate.net>
Source record: 98337

s9311912@jupiter.up.ac.za wrote:
: 1. There is 2 io ports on the disk dirves, which one do I use ?

You can use either one, the serial bus on the Atari is kind-of a daisy chain scheme, plug one from the computer into the drive, then from the drive plug another cable to another drive or another serial bus device.

: 2. On what voltage does the drive operate ? (I didn't recieve the PSU)

The 1050 disk drive power supply has an output of 9 VAC, and 31 VA, input of 120V, 60Hz, 50W, it is a fairly common power supply with Atari computers, it is used both on the 1050 and XF551, and probably some other disk drives and components.

: 3. What does the 'drive select' swtich do ?

These switches allow you to select the device number of the drive, it is necessary to have different device numbers otherwise there will be (probably) a device timeout. On the 1050 the switches are as follows:

There is two switches, one is usually behind the other, a black and white switch, here is the combinations for each of the four device numbers:

Drive 1: black only on left side (white should be behind the black switch)
Drive 2: white on left, black on right
Drive 3: black only on right (white should be behind the black switch)
Drive 4: black on right, white on left

: 4. What type of disks does the drive use ?

The 1050 is a single sided, enhanced density drive, so it should take SS/DS DD diskettes (DS is your best bet, notch them and you can flip them and write to both sides), with the right DOS you can initialize the disks to their full capacity with this type of drive.

: 5. What type of carridges does the computer use ?

I guess you mean cartridges, they are cartridges that are for Atari Computers, anything else will not work, most will say they are for the Atari 800, but they should still work.

: 6. How can one interface the disk drive with the computer ? (I didn't
: receive any cables)

Check the vendors list (posted here frequently) for a company called American TechnaVision, they sell the cables which are commonly referred to as SIO cables.

: 7. What is the parallel bus connection for ?

There is very few devices that can take advantage of the PBI, there was a memory upgrade that could be hooked into an 800XL and provide 256K RAM, it might be still around, I think it was Yorky? But the PBI can have many uses it provides most of the necessary signals from the processor, so you can always design a device around it.

: 8. How much memory does the machine have ?

The 800XL (stock) has 64K RAM, but I have seen upgrades from 256K and higher.

: 9. A pinout of the IO cable would be appreciated.
: 10. Pinouts of the Monitor/Power connection ?

I can and would help you with these, but my books are buried, if no one answers it then drop me a note and I will reply during the weekend (when I am not working).

5354. Hard Times (hacks)

Newsgroup: comp.sys.atari.8bit
Date: 1994-09-20 18:32:46 UTC
From: d92-pro@donau.nada.kth.se
Message-ID: <D92-PRO.94Sep20203247@donau.nada.kth.se>
Source record: 98335
Cross-posted to: comp.sys.atari.advocacy,comp.sys.atari.8bit

Ok, as a first time poster, i'll apologize for anything upsetting it
the following text.
(so, done! Flame shield is UP! *8))
I suddenly remembered my old (OLD) atari 1040STFM,
lying in a box totally in peices, and thought to myself

- Wonder if I could connect it to my modem (2400Bps), and sotof
connect it to my schools modempool, and read my mail?

After some small assambling (of peices), and some checking of disk's,
(with about 60% or so broken/jumbled)
I came to insight of what i had to work with:
1 atari 1040STFM, one 2400bps hayes modem, and (gasp) KERMIT.
(and yes, it DOES connect to the computer, AND to my school. WHEE!)
so, what to do now is one teeny-weeny bit of improvement,
to replace the KERMIT ver. 1.05 beta (or something) to a neater,
nicer, more user-friendly communications tool.
I finally am tired of manually typing ATD<nr>, ATH, AT&W AT<foo>......

Any suggestions?

Oh. Uhm. Since i dont hang around in this newsgroup too much
(actually, firsttime-visit)
I'd rather have reply's by mail to
d92-pro@nada.kth.se
(and yes, I will trim up the answers, and repost them on request)

/Many thanx in advance,
Phil

>less than 10 seconds at 19,000 CPS. But even 14.4 baud modems with data
>compression can't do that much I don't think.

No, they can't. I've gotten 3000cps sending text files with a 14.4,
(with a mac serial port set to 57.6) but I'd guess that's about the upper
limit unless you're sending files that are amazingly compressable. Like
.BMP files in the IBM world, or maybe Koalapad files with an Atari.

Give me credit for a bit of exaggeration, though. :) 19200 baud seems
ridiculous after all those years of taking an hour to receive a 64K text
file on my 1030....

>For the purpose of data, the theoretical limit is 56K baud off the SIO.
>The main problem with RS232 (let's assume a buffered UART hanging off the
>SIO like an R:P: would be) is the overhead in the RS232 handler as
>serviced by a 1.79mhz processor. It still has to move bytes in and out
>of SIO and therefore your practical limit is somehwere between 1400 CPS.

I also suspect that unless you're sending or receiving straight to a RAMdisk
or a hard drive that you're not even going to get that. (Maybe with
syncromesh or one of the modification schemes for the 1050.) An
unmodified 1050 or 810 disk drive (having never used one of the Atari
true double-density drives, I can't comment on them) is going to slow
things down considerably when the Atari loads/writes out the buffer.

But this is all besides the point-- anyone have any advice on an Atari to
Mac linkup?

Now I know how Tantalus felt....
I can see refman.txt and refman.zip, but when I try to get them, I
just get "Permission Denied."

I guess I'll have to try again tomorrow.
I wonder how much of the reference card I'm working on is in there...
(I'm about half done, and I'll post or upload a preliminary version as
soon as I get some error codes typed. I'm not quite sure how to
handle those character charts, though.)

fbnx@aol.com (FBNX) wrote:

F> Any idea which issues, or about what time?
F> I'd love to see the article!

1.) CREATIVE COMPUTING, MAY 1984, Vol. 10, No. 5 ($2.95)
2.) CREATIVE COMPUTING, JUNE 1994, Vol. 10, No. 6 ($2.95)
3.) CREATIVE COMPUTING, JULY 1984, Vol. 10, No. 7 ($2.95)
4.) CREATIVE COMPUTING, SEPTEMBER 1984, Vol. 10, No. 9 ($2.95)

Whoops! My mistake, did I say BYTE ? I should have said CREATIVE
COMPUTING. The pertinent information follows:

1.) CREATIVE COMPUTING, MAY 1984, Vol. 10, No. 5 ($2.95)

Cover color: Black fading to Midnight Blue
(Cover picture: Young executive type with feet up on desk and
left hand on keyboard typing on a WANG professional computer. A flower
vase with two pink flowers rests on the table by his feet. A corner-cut
banner high in the righthand corner reads: "POWERLINE PROTECTION".)

"In This Issue" Table of Contents (Note: Special red seal
commemorating CCs 10th Anniversary) Sub-heading box Chapter Title --
"APPLICATIONS & SOFTWARE". Starting Page given: p. 152. Article Title --
"Structured Programming In BASIC" by Leuhrmann, subtitled: "Part 1:
Top-down BASIC".

PAGES USED: 152, 153, 154, 155, 156 (6 pages)

(Synopsis: The author of the article is Arthur Luehrmann. This
article explains top-down programming style and how to use sub-routines.
The exercise is to write a program that generates a full song when given
two motifs to combine.)

2.) CREATIVE COMPUTING, JUNE 1994, Vol. 10, No. 6 ($2.95)

Cover color: Grey fading away to white off-tope
(Cover Picture: EPSON Equity green screen monitor with
pie-chart. Wall Street Journal on left side. Memotech keyboard and

printer. Cup of coffee above Memotech. SORD IS-11 laptop. A high-light corner-cut banner across the top right-hand corner reads: ELECTRONIC SPREADSHEETS.)

"In This Issue" Table of Contents, Sub-heading box Chapter Title -- "ARTICLES" (Note the change from being under the "APPLICATIONS & SOFTWARE" box. Starting Page given: p. 152. Article Title -- "Structured Programming In BASIC" by Leuhrmann, subtitled: "Part 2: Control Blocks".

PAGES USED: 152, 157, 158, 160, 163 (5 pages)

(Synopsis: The author of the article, Arthur Luehrmann discusses the BASIC language and the nature a "spaghetti coding". The author goes on to explain how modular, structured coding blocks can be written within the limitations of an unstructured BASIC by structuring the BASIC yourself. He describes the LOOP block conditional. He describes the IF-THEN-ELSE conditional. He codes a decision block that queries the user for input while avoiding the traps of spaghetti coding.)

3.) CREATIVE COMPUTING, JULY 1984, Vol. 10, No. 7 ($2.95)

Cover color: Light olive green
(Cover Picture: A paintbrush with a wire coming out of the back of it is sloshing wet paint onto a monitor's glass tube front. The words "Focus on Graphics" appear just above the brush. A high-light corner-cut has a picture of the new Macintosh and the HP110 laptop.)

"In This Issue" Table of Contents, sub-heading box Chapter Title -- "APPLICATIONS & SOFTWARE". Starting Page given: p. 125. Article Title -- "Structured Programming In BASIC" by Leuhrmann, subtitled: "Part 3: An Application" (Note: Evidently the printers goofed last issue and now moved it back to the correct chapter box in the table of contents.)

PAGES USED: 125, 126, 129, 132, 135, 136 (6 pages)

(Synopsis: The author of the article, Arthur Luehrmann no longer discusses theory and technique, but rather, uses a "hands on" approach to demonstrate how to program an application in BASIC using the top-down technique, even though the BASIC is unstructured. The example he leads the reader through is an example of a "Mastermind(tm)"-like game applied to text words. What amazes this reader is that the finished code looks as clear to understand as PASCAL, even thought the author is coding in an unstructured BASIC ! AMAZING!)

4.) CREATIVE COMPUTING, SEPTEMBER 1984, Vol. 10, No. 9 ($2.95)

Cover color: Navy blue
(Cover picture: Blueprint orthagonal three perspective drawing of the front and side views of a monitor and drive unit as well as a keyboard unit are laid across a table. On top of the blueprint we see: a disk drive unit and its print-circuit controller board, a monitor, a needle-nose pliers, a Sakata monitor, a screwdriver, a memory board chock-full of RAMs, a Hercules graphics board. In the middle of all this

we find the following words: "Upgrading Your PC". There is a red corner-cut banner in the top right-hand corner proclaiming, "ENTERTAINMENT SOFTWARE".)

"In This Issue" Table of Contents, sub-heading box Chapter Title -- "APPLICATIONS & SOFTWARE". Starting Page given: p. 171. Article Title -- "Structured Programming In BASIC" by Leuhrmann, subtitled: "Part 4: ANSI BASIC, Macintosh BASIC, and True BASIC"

PAGES USED: 171, 173, 174, 175, 177 (6 pages)

(Synopsis: The author of the article, Arthur Luehrmann, discusses the early roots of BASIC development at Dartmouth College, the problems reconciling Dartmouth BASIC with Bill Gates' BASIC, the new ANSI BASIC and True BASIC, and the state of "modern" (i.e. 1984) BASIC today. The author them goes on to show his guessing game coding example as it is coded using the new 1984 ANSI BASIC.)

* * * * *

Well, that is all the information that I could dig up. Glad I could be of help!

5360. .alf Extension - What is it?

Newsgroup: comp.sys.atari.8bit

From: ah818@freenet.buffalo.edu
Message-ID: <CwH91E.LHs@freenet.buffalo.edu>
Source record: 98342

In getting back into my Atari 800XL I've been browsing the net to find what's available information-wise and came across a file that, I believe, is a 6502 assembler tutor. Unfortunately it looks to be a dsk image of some type. Tries using dcm2dsk2 on it, but no luck. Unrecognized format. Tried unarcing it also. Again no luck. Any ideas anyone?

What I'm looking for is some basic tutorial on 6502 assembler to use and guide me in learning forth on the Atari. Always open to being educated.

Source record: 98339

As previously announced, The Atari 8-bit Omnibus will be released this October. It will be a comprehensive guide to resources for the 8-bit Atari. Free classified ads are available until midnight, September 30. Whether it's a "Wanted", "For Sale", "BBS Number" or any other sort of 8-bit related ad, send it to the Omnibus!

Free classified ads will be accepted, subject to the following limitations:

(1) Maximum 50 words/ad, two ads per person. Editor decides what constitutes a word. Editor will edit oversize ads.

(2) All ads must pertain to the Atari 8-bit computer line.

(3) All ads must include the advertiser's full name and postal address. Email and phone numbers are a good idea as well.

(4) Advertisers offering software may only offer software originals. Ads offering pirated software will be refused.

(5) Editor and publisher are not responsible for personal losses dues to situations arising from these ads.

(6) Hope nobody was scared off by all this.

(7) Send ads via Email to:
D.PATERSON2@genie.geis.com
Use the message title: Omnibus Ad

Thanks for your support. Watch for the release announcement later this month.

Message-ID: <CwJB2K.4G7@cbnewsl.cb.att.com>
Source record: 98345

HELP. If I can't sell my Atari 800 system to some deserving soul, my wife will make me put it out in a garage sale. I have:

* Atari 800 CPU with 48 kbytes of RAM
* Atari 410 tape unit
* Percom SS DD Disk Drive
* Atari 850 interface module
* All Atari specific cables and power supplies
* Cartridges - Basic
Turmoil
Star Raiders
Atariwriter
Centipede
Missile Command
* Software - DOS (Percom)
Music Construction Set
Adept
Matchmaker Spanish Vocabulary
Conversational Spanish (Audio + Programs on tape - early multimedia!)
Syncalc (Spreadsheet)
Spell Magic (Spell checker for Atariwriter)
12 disks of misc games
* Documentation - Atari 800 User Guide
Atari 410 Owner's Guide
Percom Disk Drive and Percom DOS Manuals
Basic Manual
De Re Atari Programmer's Guide
Operating System User's Manual
Operating System Source Listing
Hardware Manual
* Missing - Joysticks
TV/Game switch

All are in working order. I'm asking $75.00 + shipping. I'd be willing to donate the system to anyone who would acknowledge a $350 equipment donation on letterhead of a school, etc that can get me an income tax deduction.

Please reply via email.

Did anyone out here get the Halle Project 1994 demo from UMich to work?

My copy starts reading sectors in very large jumps (instead of 100, 101, 102, etc. it goes like 100, 200, 300..800 and then it dies).

If you got it and you have a PAL machine and it works, then I'm screwed.

If you got it and you have a PAL machine and it DOESN'T work, then IT'S screwed and someone'll have to reUpload it :)

If you got it and you have an NTSC machine and it WORKS, then I guess I'm screwed too!

thanx in advance!

-bill!
kendrick@vax.sonoma.edu ||| kendrick@zippy.sonoma.edu
William (Bill) Kendrick / | \ ** New Breed Software **

ON A SIDE NOTE: Did anyone out here get the PARTRO.DCM demo to work? I made a hacked copy of it which can be loaded from MyDOS.. when I try to load the demo parts by booting (OR loading from MyDOS), all they do is jump to the Self Test... if you too have this problem, tell me and I'll UL my hacked copy to UMich (or at least the TBXL code which you can run to fix the parts)

Later!

It's been talked about...sadly, nothing really has been done. There was a
fellow on IRC for a while under the name MrSpock who held open a channel
#atari. Oddly the only thing he'd say when you joined the channel was
"go away", I know several people that this happened to. As far as how, I just
set up an IRC user end here and log into dwey.texas as my server. Last I
checked, the IRC on Freenet was up, just a closed system...

I am in the process of clearing out some of my "extra" Atari hardware...
Here goes the list. You would pay shipping.

1 Atari 130XE with 320K RAM and 1.5A power supply --- $50

1 Atari 800XL with Atari Classics SuperVideo Upgrade
and 256K RAM with 1.5A power supply ---------- $50

1 stock 64K RAM Atari 800XL no power supply --------- $25

1 stock 64K RAM Atari 800XL no power supply -------- $25

1 Atari 800 with RAMROD XL, OmniMon, etc.
has 52K of useable RAM with power supply and
instructions ------------------------------------ $40

1 Atari 2600 Jr. no power supply ------------------- $10

1 Sears (Atari 2600) Tele-Games machine with p/s --- $10

2 Atari ST mice ----------------------------------- $5 each

If interested send e-mail.

Source record: 98206

Just curious how the great folks at ABBUC scan all the images in - for use with their ABBUC magazines?

Are you doing it on an 8bit Atari - or some other machine? If on an XL/XE, what software/hardware are you using?

I have computereyes, but the resolution is terrible - even if sitting directly in front of the video camera.

Any ideas/suggestions greatly appreciated.

[illegible] 1-The Shadow
[illegible] 4-Jeremy
[illegible] MagMa update
[illegible] MagMa update
[illegible] 0 [illegible]

As I told you earlier on the phone,
while I was stationed back East, I had
occasion to track down MagMa Ltd. and
find out some neat new facts, as well
as pick up a few goodies.

MagMa it seems is basically closing
out, and moving to Greenwood, BC. Due
to his inability to find the parts

needed for most of his line, coupled with Atari's dropping the computer line, he has entered into negotiations with Comp-A-Tari to purchase the rights for his line of goods. C-A-T is located in Beaver Creek Oregon, and the owner is the former President of the Beaver Creek Atari Club. He is planning on negotiating with Shadow to further the programming, and help in marketing these wares. To date, Shadow has been unable to give me a progress report though.

I did manage to pick up one of MagMa's 80 column carts though, along with the Terminal Cart, and I can tell you first hand, they are better than anything I've seen for the 8-bit in a long time. I guess the catch 22 is if C-A-T can find the needed parts to keep this stuff alive. I guess only time will tell.

Glad to be back home, and even happier to see Terry Ortman has been muzzled.

Jeremy

To anyone using the recently released versions of SpartaDOS X32G or X32GX from FTE...

Be aware that at least two BBS Express Pro sysops have had problems with this DOS not closing files that have been opened for read and/or update.

SysOp*Crazy on the Inside The 8-Bit West BBS had a hard drive partiton get a scrambled directory tree and file allocation table as a result. And I had a file from one directory somehow end up in a totally different directory with an invalid filename (i.e. hearts in the filename).

I was able to erase the invalid file using wildcards and fix the damage using CLEANUP.COM from the SpartaDOS Toolkit. SysOp*Craz was not so lucky and had to rebuild a hard drive partition.

When using these new DOS versions, bear in mind that the amount of testing that has been done on them is rather minimal. It is suggested that you try it out on floppies only for awhile. I myself have gone back to X32C.DOS until FTE addresses the subject directly.

A public service message from:

Doc, SysOp

Starfleet Sickbay BBS

716-873-4833. 300 to 14.4k BPS

Satellite TV, The Future is NOW!

Unfortunately, they were out of all
of the Ram-Carts. He says he has been
unable to get the needed chips.

The good news is he is negotiating
with C-A-T to take over the entire
line and market it. Since my last
post, I was able to reach Shadow, and
he confirmed that if indeed C-A-T did
aquire the rights, Shadow Software
would be the marketing agent for the
goods. This list is pretty
impressive, but I can't say as to when
it will be available or if the rights
will actually be obtained by C-A-T.
Shadow said it was not yet a done deal.

The line consists of:

1-16 meg Ram-Carts
Clock Cart
80-Column Cart
GOS Cart (DeskTop by Shadow on Cart)
Midi Cart
Terminal Cart with or w/o built in
modem, featuring full color ANSI, and
80 columns.
LAN Cart(s)
CADD/CAM Cart
8-Cart adapter (Maxi-Cart)
and an XE Adapter

He also said Carts were in the works for Carina on a Cart (v3.0!!!), a HD interface Cart, and a Disk Utilities Cart. If this makes it to our area, perhaps this stuff will be available really soon. (Come to find out, Shadow has done a lot of programming on some of this stuff)

While I haven't confirmed this with Shadow (I forgot), it looks like Carina v3.0 may be cart based, pretty interesting.

You are partially correct. We have been working on putting MOE, and the transfer protocols, and a few other things on cartridge to free up the RAM which is taken up by MOE now, and also to greatly increase the d/l protocols and speed. I am basically trying to put all time critical stuff on cartridge, but it is yet to be seen if it will all work as planned.

Tom Hunt has updated some of his programs for the new 3.2g/gx versions of SpartaDOS (but see my previously posted warning about this DOS version). The CTH Command Shell has been updated, and also SnapShot (the task-switching program).

On another front, John Picken has come up with a modified version of MyDOS and a ramdisk handler that he wrote, that allows (get this) SpartaDOS and MyDOS to share a common ramdisk! He's written versions of his ramdisk handler for both the X32D and X32g/gx versions of SpartaDOS.

John also updated the disassembly of the XE operating system that's been floating around for a few years. His version is much more heavily commented and should be of interest to programmers who can save a lot of time by using this as a reference instead of doing your own disassemblies of the Ataris OS.

And Larry Harris' Atar-Z-Modem has been updated, the latest version supports the Z-Modem RESUME function!

He who thinks the 8-bit is dead, has his head in the sand or does not own a modem. <grin>

Source record: 98213

Hello folks !

Because I don't know how to get in kontact with other german users of the atari 8-bit computers I'll use this group.

Some weeks ago Frederik Holst told me that a new german newsgroup for atari-8-bit-machines does exist, t-netz.rechner.atari.8-bit .

Now i tried for some weeks to get this newsgroup routet to my Internet-PC . Without any result. I wrote messages to the admins of the gateway-server to the internet but they told me, that they will route everything they can.

And another user told me that there is no atari-8-bit-group on the t-netz-list.

Now my questions: Are there other users too having problems with this group ?

Is anybody here countinously read this group ?

Thank you !!!

Matt
P.S. Please reply to belitz@genesis.informatik.rwth-aachen.de 'cause there are sometimes mistakes with my adress in the header.

P.P.S. I've alredy mailed to Frederik directly, 'cause I didn't get any reply 8-(

I first heard about the ramcarts over 2 years ago. I tried a couple times to mail MAGMA SYSTEMS for a catalog and failed to get through even when I used certified/registered mail. So eventually I came to the conclusion that either Shadow is a bullshit artist, or Magma is irrelevant to americans due to its postal unreachability. It was several months ago that I learned that Magma systems was going under and all I could do was boil inside for the fact that Magma probably was cursed by an owner who wouldn't give a phone number for his business and obviously couldn't receive mail from the states very easily and seemed ignorant to this fact.

The big thing about these ramcarts isn't their use as a substitute for an MIO ramdisk or banked ram, but for the mythical "linear access mode". Don't ask me how it was supposed to work, but Shadow said that the newest version of Textpro could recognize it and give you a huge linear buffer. Take anything Shadow says with a grain of salt. Even if what he says is true, the millenium will come before we see any proof of it which is too bad.

5397. Best Video Monitor

Newsgroup: comp.sys.atari.8bit
Date: 1994-09-24 06:05:39 UTC
From: b.poehland@genie.geis.com
Message-ID: <199409240605.AA247886728@relay2.geis.com>
Source record: 98231

I'll agree with Tom Drake casting my vote for the 1084 as perhaps the very best split-video monitor. The other Commodores come close, but the 1084 was the best of the lot. What makes it better than the rest is that it has the same fine resolution all the Commodores had, but in addition the 1084 has a darker screen mask which gives better contrast & so provides more brilliant colors. The only other monitor that can match the 1084 in color brilliance is the Amdek color unit. However the Amdek is grossly inferior to the 1084 in dot-pitch resolution, its display is coarse & grainy.

Just my $.02, tho I like to think I do know a little something about 8-bit video.....

5398. XF551 Problems...

Newsgroup: comp.sys.atari.8bit
Date: 1994-09-24 06:36:43 UTC
From: b.poehland@genie.geis.com
Message-ID: <199409240636.AA276218586@relay2.geis.com>
Source record: 98223

This is for BRiTiSH who asked a while back concerning his XF551 that was having intermittent shutdowns & stuff (I only caught part of the message).

Unfortunately the remedy suggested by Jeff Potter (replacing the big filter caps) will likely not do much good. Putting in the fan was actually closer to solving the problem at the source.

ALL XF551's run hot! If you add one of the CSS upgrades, they run *blazing* hot. The culprit is that d{agnabbed Mitsumi mechanism. Those things eat kilowatts for breakfast! Try replacing the original mech with a more energy-efficient one. (Toshiba & Chinon are my favorites, they run cool, have a nice feel & even a disk-eject mechanism like the 1050 had.) Of course you'll have to diddle that stupid Shugart cable, which is too short for ANY mech but the Mitsumi. <God bless Atari.>

I installed a CSS 3.5" slave upgrade in one of my 551's & almost cooked it alive. I got by without a fan by adding LOTS of extra little fins, heatsinks & bits of metal to the existing heatsink, plus I cut a big hole in the top of the (covered it a dust screen) to permit better ventilation. It works.

A leaky or defective filter cap, as suggested by Jeff Potter, usually not cause thermal regualtor cycling. Instead, they usually just blow up the regulator completely. One way to tell visually if you think you've got a bad cap is to inspect it for shape: if the cap appears bulged out at the bottom, it's bad! Replacing a good cap with a higher-value cap won't buy you any additional thermal stability (tho it might help the supply's electronic performance a bit). His suggestin will likely be effective only in the rare case of a cap which is just beginning to fail.

I experience virtually all of my disk drive hiccups only during the summer months. Funny thing about that.....

- Ben Poehland

5399. 600xl questions

Newsgroup: comp.sys.atari.8bit
Date: 1994-09-24 07:15:33 UTC
From: jasonbar@ramp.ucsb.edu
Message-ID: <360jml$dad@ramp.ucsb.edu>
Source record: 98224

Just found a 600xl ($3 at a thrift store).
I've had an 800 and a 130xe for years and years, but wish to use
the 600xl for my official "obsolete games and computers setup" b/c
it's the smallest 8-bit Atari I have and b/c it matches my 1050 disk
drive (very important!).
2 questions: Tried to run M.U.L.E. (off of disk), but it kept gagging,
telling me to remove the cartridge. I tried the hold-down-option trick
that works on the 130xe to disable BASIC. Didn't work. How do I disable
BASIC to run non-BASIC disks?
Second question: how much memory does this have and what makes it different
from an 800xl or a 1200xl.
Thanks.

-Jason

: to access first?

Once you are in IRC it should default to a server (if not type
/server irc.uiuc.edu) then type /join #atari8 once you are logged in, it
will welcome you and give you (usually -- depending on configuration) the
motd.

5404. [--- T-EDIT ---]

Newsgroup: comp.sys.atari.8bit

From: winston@merk.com
Message-ID: <CwMr3D.KxB@merk.com>
Source record: 98232

I just gophered a copy of T:EDIT off of the ATARI archive. How come T:EDIT *-STILL-* has only --USER-- written doc.s ? What is the deal here ? Doesn't anyone --IN THE WORLD-- have the instructions that go with T:EDIT ? Does anyone have the source code to this editor or know who published it and when? Where is the documentation that goes with this editor? Would a HEX dump of the program help? I mean, is there a command dispatch table in the thing? I can't believe that after all of this time still no one has the official doc.s that go with T:EDIT ? It would be nice to find out how to set the margins, or perhaps modify the program so that you could set the margins while inside the editor. T:EDIT makes a nice little program as a generic ATARI text file viewer. I mean, VTEX is nice and everything, but T:EDIT really flies, and leaves you lots of buffer space on a stock machine. It's almost as fast as doing a "copy to E:" viewing, (e.g. C d#:<filename.ext> E: [...or E:XXX for SPARTA-G] .

5405. [--- TP512 ---]

Newsgroup: comp.sys.atari.8bit

From: winston@merk.com
Message-ID: <CwMrwu.L6s@merk.com>
Source record: 98233

I just gophered TEXTPRO version 5.12 from the ATARI Archive. (Yes, I realize that the beta TEXTPRO 5.20x is the current release and that its "Find" function is superior to that of TEXPRO 5.12.) I wanted to see how the executible "add-in" modules work, and I understand that this version explains them. When I loaded Disk Communicator 3.2 up and attempted to unpack the files, the first file ended with an error. The second file of the archive would not unpack under DISKCOMM at all, but just gave an error.

Has anyone else had this problem trying to unpack TEXTPRO 5.12 from the archive while using Disk Communicator 3.2 ? (Does the second file yield anything, or is this just one big .DCM file that was arbitrarily cut in two? I notice that the file extensions -- E1D and E2D -- seem to be mislabeled instead of reading -- DCM.) Thank you.

No, I used the -b binary flag.

> You also mention the Atari wouldn't read the disk. I've found I have
> better chances of success when I format the disk with the Atari first,

> least know you can read the disk both with the Atari and with MyUTIL.

I dug out the XT again and tried this. I formatted a Double Density disk
on the Atari with MYDOS 4.5 and stuck it in the XT disk drive.
UTIL would display the correct directory details if I did:

UTIL -L A:

and appeared to copy files from the Atari disk to the IBM PC correctly with:

UTIL -R A:

{Great, but I don't need to do this! B-) }

but would not copy files from the IBM PC to the Atari disk with:

UTIL -W -B A: <filename>

- It came up with the following:

"Unable to read the Atari disk VTOC/Bit Map! Program aborted"

>
> Hope this helps,
> --

> Michael Current, Keeper of the 8-Bit Atari FAQ & Vendor/Developer Lists
> Cleveland Free-Net Atari SIGOp: aa700 / mailto:mcurrent@carleton.edu

Yes, thanks to you and everyone else who replied. My news server site takes about 4-7 days to get mail, so I've just read this message.

If anyone else has any ideas, can you please email me (email vs. Usenet post will be a bit quicker) at : nthewarapp@ea.com. I'm using v.1.1.5 (the only one that I could get to run, I downloaded all the other versions from umich.

I think I'll try to get an 850 and transfer files by null modem, it would have been nice to use UTIL, as it's very hard to get hold of 850's in the UK.

Thanks to you all again.

Neil

5407. FlickerTerm

Newsgroup: comp.sys.atari.8bit
Date: 1994-09-24 12:14:33 UTC
From: ehalliwe@emh.kunsan.af.mil
Message-ID: <9409250553.AA05381@emh.kunsan.af.mil>
Source record: 98235

Greetings, all. (and thanks, JD for blowing my cover. geez...)--

I've been away for a while, but I'm back, bigger and better-connected
than ever. Got my own internet account.

So, in case anyone's wondering what's up with FlickerTerm... I'm
starting work on it after a brief delay while getting settled in
Korea. Currently, am in the process of adding:
Data bits toggle: 7/8
VT100 backspace toggle: BS/DEL
Output parity select: odd/even/none
Flow control toggle: hardware/software
Arrow key mode toggle: ON/OFF
(with this mode ON, you can send cursor key codes without
having to hold down CTRL-SHIFT or SELECT... just the key by
itself. disadvantage... have to toggle OFF to type -=*+)

Questions: Do any systems these days require two stop bits?
Is anyone really bothered by the block cursor? An
underline cursor could be added.
How the heck do IBMs send graphics characters that are
mapped in the 0-31 range?

All questions, comments, criticisms, and large cash donations are
welcome!

I popped into #Atari8 last night and somebody was there, but since
I was using FlickerTerm in Vt100 mode, the text refused to do
line feeds and such, and I couldnt recognize what was being typed.

I hope to have a fix for this VT100 problem before Sunday, as there
will be several folks in there this Sunday at Midnight Central time.

I'm 99% sure T-Edit was an ANALOG program written by one of the authors of the BBK team. I don't think there is a way to reset the left margin without a rewrite of the source code as it uses a VBI to update the screen. I may be able to find the disk/source code, but I had to get rid of my old Antics & ANALOGs (Wife made room for her crap by getting rid of my crap <g>).
It's a nice little editor but I never really used it enough to remember all the commands. I always prefered the Action! editor even for stuff like CC65.

It is true...The Cleveland Free-Net Atari SIG is no longer able to
sponsor Atari multi-user conferences on the Cleveland Free-Net's IRC.

This is due to a decision made by the CFN Administration. The CFN
Administration has taken away IRC access to the SysOps of Special
Interest Groups on CFN. No explanation was given other than "SysOp
accounts should only be used for moderating Special
Interest Groups".

Thanks, Glenn for telling me how many tracks to set up the drive at, there's one more thing it asks for though. Do you know what the step number is? I tried 1 and then tried to format a disk but no luck. Did you say that this drive is double sided?! Does that mean I would still be able to use it to transfer files to a PC using Util or something like that? If it is double sided, is it compatible with the Xf551 format and does MyDOS support this? Well, that's quite a few questions for one day. Any help you can give me would be great.

Thanks, Andy

First&Second Answer: the 600XL has just 16K (stock). I've got to believe
M.U.L.E. requires more memory than that. Other than the memory, the 600XL
is identical to the 800XL.

WANTED: 850 or similar interface for Atari 8-bit

I'm looking to buy a serial interface for my Atari 800XL, so I can
transfer files to and from my Macintosh using a null modem.

I'd like to source one in the UK if possible, but if not, then I can
arrange for shipping from the U.S.

Any of the following would be of interest:

850 Interface Module
P:R:Connection
Multi I/O
Black Box
Datari interface

or any other serial interfaces.

I'll also need a terminal program for the Atari and appropriate R: drivers.

Please address replies to "nthewarapp@ea.com".

Many thanks,

Neil.

T: Edit was written by Bryan Schappel, and published in the May 1987 (No. 54) Issue of A.N.A.L.O.G. Computing (Atari News And Lots Of Games) Magazine -- back when I was a sophomore in high school. The article begins on page 44 and runs through page 51. Brief documentation (about 4 pages) is provided, along with a type-in (remember that?) BASIC loader program which creates the executable TEDIT.COM file. Typically A.N.A.L.O.G. distributed the 6502 assembly language source code for all of the programs published in their monthly magazine; this source code was obtained by paying an additional fee for a disk subscription to the magazine. Usually, this source code was commented. I am sure someone on the net can provide you with this MAC/65 source code. If not, I may have it around somewhere myself, but finding it would be quite a chore.
I do not believe the original version published in the magazine was ever upgraded or revised, but I could be wrong on this. I agree, it is a very fast editor. I believe it achieved the rapid display rate by patching into the E: device or writing directly to the screen RAM instead of going through the device drivers with legal CIO calls.

Why not just order one directly from Fine Tooned Engineering or CSS?

BTW: If you live in the Ottawa/Carleton area, I can xfer you FlickerTerm
if you want it. It uses R: ports.

Source record: 98251
Cross-posted to: uk.forsale,comp.sys.atari.8bit,misc.forsale.computers.wanted,misc.wanted

Hey, maybe pre-order an R:P: Connection from C.S.S. in Rochester New York -
I'm not sure when they'll be out, but pre-orders will probably help get them
out more quickly. They connect up to ANY Atari 8bit (unlike Black Box and
MIO which connect to the PBI port) and go up to 19.2k bps.

As for terminal software, check out:

Kermit65 if you ever need to do Kermit stuff
Ice-T (not out yet) for fast 80 columns and VT
FlickerTerm80 (ditto but using a differen approach to 80 columns)

and last but of course not LEAST!

BobTerm 1.22

BobTerm comes with R: handlers, is shareware, does up to 19.2k (like Ice-T and
FT80), supports X/Y modem and others (Ice-T does X so far, but like I said,
it's not out yet), I dunno about FT80's U/D support currently. Kermit does
Kermit (obviously) and I THINK X?

Also, there's always AtarZModem which is an external program which does Z-mod.
downloads (I wonder if you can run it as a Module in BobTerm? That'd be cool!)

On Monday, September 19, 1994 at 07:28:12 GMT (2:28am EST ?)
s9311912@jupiter.up.ac.za () Carl F. Swart wrote:

CS> During the weekend I recieved two ATARI 800 xl's and two 1050 ATARI
CS> disk drives. I don't know anything about this stuff but did manage
CS> to get it working.
CS>
CS> I do not know how old they are but they are working.
CS> I would like to ask all you intelligent life out there for some
CS> answers to a few of my questions. Here they are !!!
CS>
CS> 1. There are 2 IO ports on the disk drives, which one do I use ?

Either one, as far as I know. It is an IEEE "daisy chain" called the
ATARI SIO chain(?). As far as I know, there is no "IN" port or "OUT" port.
Just chain the hardware together with SIO cables -- 13 pin connectors with
ends in the shape of trapezoids. (Cables supplied by BEST ELECTRONICS,
AMERICAN TECHNAVISION, TOAD COMPUTERS, etc.) It functions similar to MAC
"AppleTalk" or an EtherNET LAN.

CS> 2. On what voltage does the drive operate ? (I didn't recieve the PSU.)

What type of voltage do they use in southern Africa? 50hz DC ?
120hz AC ? I don't own an ATARI 1050 disk drive (which is the standard), I
own the two oddball ATARI drives, the ATARI 810 and the ATARI XF551.
(Their power ratings would probably be of little or no help to you.)
I understand that the 1050s work well in SPARTADOS "burst I/O" mode. I
prefer using MYDOS 4.5x on my drives. You might want to check whether or
not your drives are "single density and a half" stock 'enhanced' density
drives, or have been modified via a "U.S. Doubler" kit into true double
density drives. What DOS are you using, and what does it give you for a
sector count?

CS> 3. What does the 'drive select' switch do ?

If you are referring to the slidable square tab in the square cut-out
at the back of the drive... then there are --TWO-- of them, one behind the
other. These sliding tabs set the "device number" on the drive so that you
can refer to the physical drive unit as "D1:", "D2:", "D3:", "D4:", as in
the command LOAD "D1:MAZCHASE.BAS" .

CS> 4. What type of disks does the drive use ?

Non-high density, standard MD2D five and one quarter inch floppy
disks, same as the IBM XT class machine does.

CS> 5. What type of cartridges does the computer use ?

Practically every classic 8-bit computer game ever invented has an ATARI game cartridge that went with it (until Nintendo hit the market). These are --NOT-- the VCS cartridges, nor the 2600 cartridges, nor the 5200 cartridges, nor the 7800 cartridges. The cartridges that run on the ATARI computer are known as "ATARI COMPUTER CARTRIDGES" or "ATARI 400 CARTRIDGES" or "ATARI 800 CARTRIDGES" or "ATARI HOME COMPUTER" cartridges. The most famous of these is "STAR RAIDERS". The second most famous of these is "POLE POSITION", a racing car game. There was also MISSLE COMMAND, PACMAN, DEFENDER, ASTEROIDS, SPACE INVADERS, CENTIPEDE, DIG DUG, etc. Cartridges also included programming languages such as ACTION!, LOGO, PILOT, MAC65, BASIC. The computer cartridges begin with the prefix "CXL", for example the "PACMAN" catridge is "PACMAN: ATARI COMPUTER GAME CXL4022". An extensive list of these computer cartridges is available here and on the ATARI archive (or should be).

CS> 6. How can one interface the disk drive with the computer ? (I didn't
CS> receive any cables)

You need an ATARI SIO CABLE (between five and ten American dollars mail-order). They have funky trapezoid connectors.

CS> 7. What is the parallel bus connection for ?

Expansion boxes to run generic drive controllers that run hard drives or floppy drives. Some of the more popular boxes are the "Black Box", the "M.I.O." and the "ATR8000". (Note: The ATR8000 has a Z80 in it.)

CS> 8. How much memory does the machine have ?

A maxed-out ATARI 400 has about 48K in it. An ATARI 800XL should have about 52K in it, or 64K if you count one of the RAM banks that is non-contiguous. (I'm not exactly sure so let's call it 52K to be conservative.) You disable ATARI BASIC by powering up the machine while either holding down, or not holding down the [OPTION] key. Turn on your machine. When you see the "READY" prompt, type: PRINT FRE(0). You should have about 32K of free BASIC program space. Now enter "BYE" and select self-test #1, "MEMORY TEST". That should tell you how much working RAM your machine has. The two big rectangles at the top are your ROMs. If these don't light up then you have problems. Each tiny square is a chunk of RAM. (Is it 1 square = 1 K of RAM ?). All the squares should light up and then the sequence should repeat again. If it doesn't repeat then you may have problems.

CS> 9. A pinout of the IO cable would be appreciated.

Pinouts of the ATARI devices are posted here practically weekly. Stick around for a while, and by October first you should have a pinout for every ATARI device ever made.

CS> 10. Pinouts of the Monitor/Power connection ?

These are posted along with pinouts of the of the SIO cable, pinouts of the ATARI 850 RS-232 ports, pinouts of the PBI Expansion bus, pinouts of the ECI Expansion bus, pinouts of the Joystick ports, pinouts of the disk

drives, pinouts of the ATARI 1200XL, pinouts of the.... You can FTP the "FAQ" (frequently asked questions) text file from the ATARI archives at UMICH, have someone e-mail it to you, or just follow the group for a week. What brand of monitor do you currently use?

CS> PS: I'm A PC man ... just checking out these ATARI's for fun .

"Fun" is the operative word. What you have is essentially a "baby AMIGA" designed by the home computer wizard, the late Jay Miner. The machine is all fun, which is why people still hold onto them.

I've got an expensive "cable" that does this: It's my VCR. I have an
old Commodore monitor that a friend gave me, so I would like to use a
direct cable, but I'm not sure how to go about it. I suppose the
monitor cabling is (or should be) in the FAQ (which I haven't seen in
a long time).

> BASIC to run non-BASIC disks?

Problem is the older versions of M.U.L.E. check for ROM at $C000. If
your computer has a ROM program there, it won't run M.U.L.E. The XL
series have ROM there that was unused in the 800 series. Why does
M.U.L.E. do this? It's checking for an OMNIMON! which is used to crack
software among other things. I had a switch on my system that would
engage and disengage the ROM there which was a good thing as EOA had
some of the best copy protection schemes of the time. You need to get
the cracked boot disk or the cracked file.

> Second question: how much memory does this have and what makes it different

Getting copies of the AR games as disk images would be pirating and that's not liked very well here. (it's especially rude since the author of the series READS this newsgroup (or at least he used to?))

Contact an Atari software dealer and then see if you can crack a copy yourself- it's probably much more legal and morally correct.

To heck with a multi-tasking OS9-style kernel !

It would be nice just to have the UNIX lexical tools like GREP and DIFF.

Speaking of multi-tasking, I seem to remember a task-switching program
for the COMMODORE PET that divided BASIC program space into four parts
and kept a stack of four program counters so that you could switch
between four running programs with a keyboard interrupt suspend-and-run
round-robin style. It was a neat trick. Hmm... I wonder if they could
have added a task scheduler to that and have made it pre-emptive?

This shouldn't be too difficult. The unix source for them is freely
available from the GNU archive at prep.ai.mit.edu. I'm sure they're
simple enough to be converted to CC65 or Action for SpartaDOS.
The hardest part for Atari people would be expanding a tar.gz file.
(I wonder if tar and gzip could be converted.....?)

I can almost guarantee that I won't have time this year to do it,
though.

I may be wrong, but I've *never* seen or heard of an Atari 400
that had any more than a 48k upgrade.
Of course, there may be an Axlon style mod, but I don't think
that would work with any sort of Unix that needs _contiguous_
RAM as opposed to bank switched.

But hey, that's just my thoughts and they're often wrong.

Tim Hester

No you can't. You have to use an autoreverse tape recorder connected to your
atari 400 with a special interverse. This way it just plays and record along
and it can wait until the swapped process passes by again. But remember, only
use C-15 tapes to cut down the swapping process to an average of 30 mins.

I have the Following Atari Classic 8
Bit HardWare Item's for Sale.

PS=Power Supply.

130XE
Atari
128K, PS, Manual, Stock.......$75 U.S.

800XL
Atari
64K, PS, Stock.................$50 U.S.

800XL
Atari
64K, no PS, Stock.............$40 U.S.

800
Atari
48K/52K/1mp?, 40/80 Col,no PS.$50 U.S.

800
Atari
256K Happy Compat Ram Disk * Makes One
Pass copies with Happy Drive, OmniMon/
800 OS/?, Cold Reset Button,Pill Chip,
PS included...................$80 U.S.

800
Atari
48K, No PS, Stock.............$20 U.S.

810
Atari
SSSD, PS included, Stock......$30 U.S.

850 Interface
Atari
MoDeM and Printer Interface, 4 Serial
Ports and 1 Parallel Port, Built in
Handlers, Lets your Atari use standard
MoDeMs and Printers, no PS....$50 U.S.

1050
Atari
SSED, PS, DOS, Manual, SIO Cable,
Stock & Standard..............$70 U.S.

1050
Atari
SSED, PS, DOS, SIO Cable, Stock,
Standard.....$60 U.S.

1050
Atari
SSED, no PS, S&S.....$50 U.S.

ATR8000
SWP
CPM, PS Built in, CPU only....$50 U.S.

MPP-1100
MicroBits Peripheral Products
Printer InterFace, No PS Needed, Plugs
into Joystick Port, as is.....$10 U.S.

CX85 Numeric KeyPad
Atari
Plugs into Jostick Port.....$8 U.S.

XM301 MoDeM
Atari
Direct Connect, needs no PS....$8 U.S.

1010 Program Recorder
Atari
Cassette Storage, cheap storage alter-
native, PS included.....$8 U.S.

410 Program Recorder
Atari
Cassette Storage, Cheaper storage alt-
ernative, PS Built In.....$5 U.S.

JoySticks
Various
A variety of Joysticks, inquire for
makes, E-Mail or voice....$5 U.S. & up

All Orders shipped outside the United
States must be paid up front with a
money order bought at an American Bank
redeemable for $American Dollars.If

Sure, you could do this, UNIX would tell you every time it wants to
read swapped data: "Please rewind the tape to pos. 453". It would only
take several hours e.g. to compile a "hello world"-program...

_F_O_R_G_E_T_ _I_T_

Get a <sigh> 386-PC and use FreeBSD or something like that, it makes no
sense to write UNIX for the small Atari! :(

I found something out about MegaBlast I...

When you get powerups like plasma-blasters, a little bit of energy is added to a small line at the top of the screen. When that line is full, it begins to flash. I have no idea what to do next. Anybody know? Also, how do you do that control combination that is supposed to give you lighting? It never works for me.

The closest thing we have and will ever get to multitasking is multiple MUXed ataris communicating info between concurrent programs via physical MUX pipes (as opposed to something like Rexx) and Snapshot style task-switching.

The main problem is memory addressing. If we had a 65816 it would open up real multitasking although it would be slow at 1.79mhz....

And that's about it.

5456. Percom Drives

Howdy Glenn. I tried using 3 as the step rate but no luck again. Unfortunately, it does not have a default by press return. So I tried using Dos XL to format it double density and at first it seemed to work. I didn't get any error messages until I tried to get a directory to check if it really worked. Is it possible I have a Percom drive that does not allow double density? The only reason I'm trying to get this thing to work is so that I can use Util or something to transfer some files between the Atari and PC. If you have any new ideas (maybe using a new dos?) I'd appreciate it.

Thanks, Andy

Wait? What lightning? Do you mean other than the cool bullet-accelerator?

The only real less-documented things in the game are the options menu at the title (the trick was posted here over a year ago :)) and the star and star-lock things (sometimes you get an asterisk and when you shoot it one of a couple different horrid things happen like a wall of bombs behind the opponent or huge patterns of deflector things ("O"s)). Also, sometimes when you'd advance to the next level, the "LEVEL xx" thing would have some asterisks on it and during that next level, the speed at which items randomly appeared was INCREDIBLY increased :) <feew feew feew feew feew HAHAHAH! feew feew feew!>

:)

Is Torsten around Internet!?!?!?!?!?!??!!??!?! :) :) :)

WHOA! You don't know how to shoot the antimatter cannons! (when you get the "||" items)

It's just DOWN+FIRE if you're player one, or UP+FIRE if you're player two!

READ THE FRIGGEN MANUAL! (Well, ok, it's not a manual.. it's just the title screens... it also tells you TAB=number-of-players, CONTROL-T=change play-back speed, CONTROL-M=change music type)

OH! And that's right! CONTROL-L=lightning.. now I know what Chris Brown was talking about..

Ok.. there's ONE thing about the game I dunno about :)

later!

Actually, both the 1050 and the 810 use the same power: 9VAC (31VA according
to my C017945 PSU).

Speaking of which... does anybody know how to take apart a 1050 PSU. I've
got a dead one which I'd like to try and fix, but it appears to be a sealed
brick. :-(

Also, is there a DD kit for the 810 (I have 2).

Assuming you have an original copy, I have an unprotected copy of The Dungeon
(Yes, I own the originals, too.) and wouldn't mind supplying it. I don't
see how you are going to be able to use it with XF2 though because there's
no way to swap the disks around. Plus, The Dungeon won't load past the
"initialization" screen on XF2. Or are you planning on doing this with
an SIO2PC + an actual Atari?

Help! I'm trying to use my Atari 400 to drive a piece of external hardware that contains relays and solenoids and such. I remember an article in A+ or maybe Antic that described a printer interface that used the joystick ports -- POKE 54018, 2 causes the LSB and MSB of whatever's poked to 54016 to appear on pins 1-4 of stick 0 and stick 1, respectively. The problem is that I've got no idea how to use this information... the article or any information on using the voltage? or resistance? changes to control 5-volt relays would be very much appreciated. <grin> As you can tell, I don't really know what I'm doing, electronics-wise, and I don't want to break my Atari.

Thanks!

A regular DIN-to-5_jack "RADIO SHACK special" should work. This is a prefabricated cable that has a DIN connector on one side and five color coded RCA banana jacks on the other side. Any junk electronics parts or surplus store should stock them (at least they used to). It is such a handy thing, I am sure more than old computers must use them. I'm sure a lot of old reel-to-reel tape recorders with DIN jacks must need RCA converter cables to patch into a modern day amplifier. Make sure you know what the DIN connector on the ATARI looks like before you make your trip to the store. This cable was a fairly common item.

(R. Legault asks about using joystick ports for output.)
Here's some notes I made when I played with this some time ago. Not
sure it makes much sense.
To make joystick ports 1 & 2 output (5v high I think, 0v low.)
1. poke 54018,peek(54018)-4 (clear bit 2 to control direction of out)
2. poke 54016,255 (set all bits, sets direction to out)
3. poke 54018,52 (restore ports to addressing)
4. poke 54016,255 will set 4 pins on port a and 4pins on portb high)
Bits 0-3 will now control port a 1-4 and bits 4-7 control portb 1-4,
set is high.
female
5 4 3 2 1
o o o o o
o o o o
9 8 7 6
pins 1,2 3 4 are bits 0,1,2,3 of 54016.

5472. FTe announces MIO II

Newsgroup: comp.sys.atari.8bit
Date: 1994-09-27 14:09:07 UTC
From: F Tooned <ftooned@delphi.com>
Message-ID: <5aw3A47.ftooned@delphi.com>
Source record: 98298

Hi everyone,

Well, it's been a very busy summer here at FTe...

Even though the MARS 8 release has been delayed,
we've been working on quite a few other projects
in order to set some new standards for its' release.

One of these is the MIO II.

How would you like to attach a "new" IDE hard disk
to your 130XE or 800XL for under $100?

Our new interface plugs into the PBI of your computer,
and simply requires an IDE hard disk to operate.

You don't need an external case or power supply.
In fact, our unit will power your computer in addition
to the interface AND the Hard Drive.

We are taking advance orders for the month of
October for $79.95 (plus $5.00 shipping), for it's
debut in November.

After October 31st, the MIO II will be $99.95.

The power supplies are even switchable to 230V,
for our friends overseas.

Please direct inquiries here, as it's been difficult
to keep up with the phones in our offices lately.

Stay Tooned, as there are more suprises on the way!!

Mike (FTe)

Message-ID: <369g4o$hb3@monk.rsip.lsu.edu>
Source record: 98157

Does the Sio2PC interface allow you to address the PC's CD rom drive as if
it were an Atari drive or, if not, is there a way to do this. We have a
cdrecorder, and I'd love to be able to put all 200 5.25"'s on a single CD-Rom
for loading Atari 8bit software!

Respond by Email if possible. Thank you in advance.

Tom

|> effective only in the rare case of a cap which is just beginning to fail.

Well, I did experience the fault I described a fix for (I forget my
original suggestion); I may have been an XF551 or 1050. I didn't read
close to +5VDC anywhere on the board and suspected the regulator. I
replaced that, with no effect, and suspected the filter cap (which didn't
look unusual). After replacing that with a new one (I forget whether I
used a larger one, or one with the same value), the drive worked.

I'll agree that replacing caps has little to do with thermal stability.
But if the heat sink is fiery hot, something like a faulty cap is soaking
up a lot of current.

May be wishful thinking. A 1 meg ramdisk and HD controller for under $100? Not likely. It sounds more like MIO-lite. Actually it sounds like he took Bob Woolley's technical experiments with the IDE+1200 and slapped it onto a general purpose PBI device. I'm not knocking it, but I know FTe is not going to sell a fully capable MIO for under $100. So I doubt it will have a ramdisk or the video/modem/printer port on it, but maybe Mike will surprise us...

Hi! Yes, as long as you can load an ATR disk image (or even separate
Atari files, but that's much more of a hassle compared to using disk images)
from the CDROM (which of course, you can do!) then it's totally possible! :)

Hell, you could make a collection of 600MB (IS there that much!? PROBABLY!)
of PD Atari games (including bootable ones, of course!) and stick 'em on CD's
and sell 'em to people using SIO2PC and/or PC XFormer!!! :)

Mike,

Sounds very interesting! A couple of questions...

Will this new MIO II have a printer port, video port, and modem port?

How about RAM? If it has a modem port, will it include hardware flow
control??

Or is this MIO just an interface for an IDE drive??

Can you be a little bit more specific about its actual specs??
and what is included??

Added to Russ's comments: If you want to use more then about .2 amps
@ 5V I'd reccomend you add another power supply. The Ports also have
a built in resistance so you can connect them directly to the base
of a transistor. I'd suggest getting PNP types, that wasy they
would be off when the computer is first booted. Something like a
3904 <or is it 3906??> from Radio Shack is just about right. You can either
have the thing drive 5V stuff directly or use a relay. I've also had some
luck driving a optoisolator/triac driver for some pretty heavy loads.

Was recently reading the docs on VolksForth for the IBM, circa 1988,
and came across a reference to a VolsForth for the Atari. Anyone ever
hear of this, or know where it might be found?

AN ATARI pioneer is now cleaning out his closets and is offering this attractive package of vintage (but eminently useful) ATARI related hardware and software. All of this equipment is offered as a package. According to where the eventual purchaser lives, shipping will be adjusted accordingly (This will take a BIG box!

ATARI 800 XL computer
ATARI 800 computer (with cover)
410 cassette recorder
850 Interface (at one time one of the hardest items to locate)
1050 disk drive
810 disk drive
825 printer
18 K extra RAM
ATARI Touch Tablet!
1020 Plotter!
Magnavox mono monitor (both computers also display on a TV)
Epyx

Software
ANTIC Disk Doctor
23 START ST disks
5 COMPUTE&#65533;S ATARI ST disks
Falcon
F-16 Combat Pilot
Chaos Strikes Back
Winter Games
STAC - ST Adventure Game Creator
Blue Angels
JET (SubLogic)
Cad-3D
GFA Basic + Compiler
D BASIC

Complete Outfit - as described - $350.00

AN ATARI pioneer is now cleaning out his closets and is offering this attractive package of vintage (but eminently useful) ATARI related books and magazines. According to where the eventual purchaser lives, shipping will be adjusted accordingly (This will take a BIG box and books and magazines are HEAVY!)

BOOKS:
The ATARI Assembler
Compute's Second Book of ATARI
ATARI BASIC
The Visicalc Book
BASIC XL Manual
Mapping The ATARI - single most useful ATARI book ever published!
ATARI LOGO

MAGAZINES:

ATARI Connection - 40 issues
ATARI Explorer - 3 issues
ANTIC - 72 issues!
ANALOG - 54 issues

(169 different magazines full of programs, hints, ideas, reviews - ATARI history!)

Whole package (I am NOT INTERESTED in trying to sell these one issue at a time and answering 100 questions like "Do you have Vol. 2, #6 of ANTIC?") being offered as a group. Buyer agrees to reimburse postage - I will send BOOK rate.... $75.00.

It was running unreliably ever since he tried to get it to run at 9600 baud. He then started tinkering so much that it made it so that it really didn't connect with most callers including myself and this alienated his already small caller-base. Despite the tinkering, he really didn't seem that active as a sysop and his file areas were very disorganized. About 6 months ago, right after I visited his place in FL, I began to notice a sharp decline in his postings, and if a sysop never posts, that's usually a bad sign. He never expressed much desire at footing the networking bill. Before I left Carina I was subsidizing him with my PCPursuit. I had 30 hours to kill a month so I was able to pull him into the net no problem. So if the plug was pulled it was probably out of apathy, unreliable performance, and finances.

The Carina system is definitely in danger of dying. When I was running it it seemed small, but healthy. When I left things had eroded a lot, and I attribute much of this to the fact that 14.4 modem prices took a nosedive yet Carina had no way to support them while Pro! did, and also the fact that the much-ballyhooed Carina 3.0 seemed to vanish into the ether as Shadow focused rather on continually patching the countless bugs of the current long-in-the-tooth Carina 2.x.

My exit from the scene and the end of PCPursuit also was a factor of course. The Machine went down or converted to an ST, I don't know if Lou is still running a board or not. He didn't seem to post in any 8-bit nets so I can assume he has lost interest. And so it goes.

I think the reason is that t:edit was origonally published by analog magazine,
so in theory it is a copyrighted work and should have never made it to the net.
The doc's were in the issue that published the program (one of the few binaries
I actually sat down and typed in) If no one has any objections I could prob
copy the doc's into a file and u/l them to umich. (assuming I can find the
issue).

5503. MUX and such

Newsgroup: comp.sys.atari.8bit
Date: 1994-09-29 02:21:52 UTC
From: d.paterson2@genie.geis.com
Message-ID: <199409290221.AA128495297@relay2.geis.com>
Source record: 98178

The MUX is the MultiPlexor from CSS; it permits up to 8 systems to share disks and printer. One unit is the "master" with all the peripherals (such as a hard disk system) while the others are slaves. You have to replace the OS chips on the slave units. They all hook together via the cartridge ports; there's a connector to add another cart on top.

There also was MTOS by Tom Hunt of Snapshot fame. It was the Multi Tasking Operating System. I believe v2 could have up to 6 tasks operating on a 256k XL. It used time slices, and had fairly rigid rules for programs about screen memory and such. The program code itself could only be 16k. Programs could communicate with each other, sending messages back and forth. There was a print spooler program; there were also stories of doing an Xmodem d/l in the background while playing Monopoly.

I think MTOS is at the UMich archive.

Yeah, MUX is short for multiplexer or just multiplex.
And, as Glenn writes, CSS makes a multiplexer for us.

Nope, It's completely new...

The MIO II will ONLY attach to an IDE drive.

We are still reworking the ORIGINAL MIO's, but it's
gonna take some time to do it right. It seemed like
there was a demand for an inexpensive hard disk interface
for the 8-Bits, so we are doing it.

The MIO II has been codenamed the "Pocket MIO", because
it's very small. (and very cool)

>
>Can you be a little bit more specific about its actual specs??
>and what is included??

The MIO II is simply an IDE Hard disk interface that
plugs into the PBI. The 3 1/2 IDE drives will mount directly
to the circuit board, and will be powered by the supply
that's included.

There wasn't much reason to add a modem or parallel port, to
encourage Bob at CSS to release his R:P: Interface.

The Ramdisk wasn't really an issue anymore, as the MARS 8 should
suffice nicely.

The only real question is the 80 column interface, but that is
something that will be resolved in the next few weeks.

It just seemed to be a good time to drop all of the pre-concieved
notions about what the Atari's should or shouldn't do, and simply
MOVE FORWARD...

Mike,

I am in complete agreement with MOVING the 8-BIT FORWARD!

There is no question that FTE is attempting to do that...

An IDE Interface is new and does move the 8-bit forward.

I am encouraged that you are also in support of the R:P: Interface
release. A number of us are patiently waiting for that interface to
appear...

Then I can put my P:R Connection into mothballs <grin>!!!!

With respect to the MIO II/Pocket MIO....

Will it come with an adapter for the 130XE??

During prototype development how large a 3.5 IDE were you able to
use/check out?

And will there be a modified formatter/drive selection from within
SpartaDos for it??

Is this "new" MIO a refinement/productized version of what Bob Woolley has
been working on or completely new or is this a cooperative effort?

I know that he was working on an internal IDE for the 1200XL.

Thanks!!

How did ANALOG make this policy known? (Note that allowing free distribution is independent of owning copyright.) Does it say somewhere in the magazine that "The programs contained herein may be freely distributed after the cover date of this issue," or some such thing?

Have you ever heard of a Harddrive? With SpartaDos-X (cart vers) you still had a limit of 16meg partitions, but with a SCSI-Host adapter we had a 120meg drive hooked up for along time, think about the size of Atari files before you thing about only 120megs of space. We also had a MIO connector (that the scsi went through) with 1meg of ram that the bbs ran from. An you are telling me that Unix would not work. Have you ever seen OS9 lv2 on a RadioShack CoCoIII premptive multitasking, I still help run a bbs as ahobby that runs on one with 512k ram (enough for a 3-4line board) with a 40meg drive. So much for your idea that Unix could not exist. (os9 is a unix like os) The postoffice even uses it in systems.

(M. Current asks about ANALOG's distribution policy.)
Following is a quote from the official 'Permissions' part of one of my
ANALOGs. I always found it confusing, but it was generally accepted
that it meant that programs not forbidding it could be freely
distributed after the month of publication. Now, Larry Flynt took the
'Permissions' statement out after he took over.
"No portion .. may be reproduced in any form..... Many programs are
copyrighted and not public domain.
Due ... to many requests from Atari club libraries and bulletin
board.... our new policy allows club libraries and individually-run
BBSes to make certain programs from ANALOG available durint the month
printed on that issue's cover. For example, software from the July
issue can be made available July 1.
This does not apply to programs which specifically state that they
are not public domain and, thus, are not for public distribution.
In addition, any programs used must state that they are from ANALOG
... For further info contact..."

FOR SALE - ATARI 8-BIT SOFTWARE

Get Rich! Insurance Planning (Arrays Software), Megafont II/II+/Font Simulator Package (XLent Software), Winter Challenge $5.00/each or all 3 for $12.50

F-15 Strike Eagle & Silent Service (Microprose) $5 each

FOR SALE - ATARI 2600 CARTS

Realsports Football $3

FOR SALE - ATARI 7800 CARTS

Asteroids, Ballblazer, Choplifter!, Food Fight, Joust, Karateka, One-On-One BB, Pole Position II, Realsports Baseball, Robotron:2084
$4 each

Karateka (cart only) $3

FOR SALE - COMMODORE 64/128 SOFTWARE

Dave Winfield's Batter Up! (Avant-Garde) $6.00
Candy Land (Gametek) $5.00
Fisher Price: Firehouse Rescue, Little People Bowling Alley, My Grand Piano, School Bus Driver $5.00 each
Shark Attack! (Greg Norman's Golf Simulator) (Virgin Software) $7.50
Pocket Planner 2 Spreadsheet, Pocket Filer 128/64 (Digital Solutions), The Filer (Spinnaker) $3.00 each
Bop 'N Rumble (Mindscape) $5.00
F-15 Strike Eagle (Microprose) $5.00

USED: Professional Gambler (Load & Go) $2.50, Star Rank Boxing (Gamestar) $3.00

SPECIAL OFFER: Purchase all of the Commodore 64/128 software for only $50

All items are brand new in original boxes unless noted.

All prices include shipping. Multiple quantities may be available for some 2600/7800 titles. If interested, contact Lawrence Estep at 71450,1050 on CompuServe or 71450.1050@COMPUSERVE.COM on Internet.

13.4) What are the pinouts for the...?

Other Documents of Interest
14.1) What product developers or vendors support the 8-bit Atari?

14.2) Where is my nearest 8-bit Atari BBS?
14.3) Where is my nearest 8-bit Atari user group?
14.4) How do I use my new or emulated Atari?
14.5) What prominent Atarians are reachable by e-mail?

==========

1.1) What is this 8-bit Atari FAQ List?

The Atari 8-Bit Computers Frequently Asked Questions List was created to provide answers to many commonly asked questions found in news:comp.sys.atari.8bit, the Info-Atari8 Digest, and INFO-A8. It is in a constant state of development.

Much of this FAQ List is geared toward providing information on the various Internet resources available for 8-bit Atari users.

Where to get the latest copy of the 8-bit Atari FAQ List

The home of many FTP archive sites, automatically updated monthly:
ftp://rtfm.mit.edu/pub/usenet-by-group/news.answers/atari-8-bit/faq

The World Wide Web hypertext version, automatically generated monthly:
http://www.cis.ohio-state.edu/hypertext/faq/usenet/atari-8-bit/faq/faq.html

Usenet newsgroups where this FAQ List is automatically posted monthly:
news:comp.sys.atari.8bit news:comp.answers news:news.answers

You can also get the latest version by e-mail.
mailto:mail-server@rtfm.mit.edu, message says:
send usenet/news.answers/atari-8-bit/faq
quit

Finally, you can always ask me for a copy at mailto:mcurrent@carleton.edu

==========

1.2) What is an Atari 8-bit computer?

Under construction

==========

2.1) What is comp.sys.atari.8bit?

news:comp.sys.atari.8bit is the unmoderated Usenet newsgroup for discussion about the 8-bit Atari 400/800/XL/XE computing platform. All postings to news:comp.sys.atari.8bit automatically appear in the Internet's Info-Atari8 Digest and in BITNET's INFO-A8.

[I'd like to include the charter for news:comp.sys.atari.8bit here. Anyone know where to get it?]

==========

2.2) What is comp.sys.atari.announce?

news:comp.sys.atari.announce is the moderated Usenet newsgroup for news items and announcements related to all Atari computing platforms. This is

a low-volume, high-signal newsgroup, useful for reaching the widest possible audience when making 8-bit Atari announcements.

[need the moderator's address]

==========
2.3) What is comp.sys.atari.advocacy?

news:comp.sys.atari.advocacy is the unmoderated Usenet newsgroup for advocating the usefulness, or uselessness, of all Atari computing platforms. If you're into flaming about Atari 8-bit computers, this is the place for you.

==========
2.4) What is comp.emulators.misc?

news:comp.emulators.misc is the unmoderated Usenet newsgroup for the discussion of emulating computing platforms on other computing platforms. All emulator discussion that does not involve the Apple][, the Commodore 64, or the WINE MS-Windows emulator (which each have their own emulator groups) may be found on news:comp.emulators.misc.

==========
2.5) What is comp.emulators.announce?

news:comp.emulators.announce is the moderated Usenet newsgroup for news items about emulating one computing platform on another. This is a low-volume, high-signal newsgroup, useful for reaching the widest possible audience when making 8-bit Atari emulator announcements.

The moderator may be contacted at mailto:emulators-request@qualcomm.com

==========
3.1) What is the Info-Atari8 Digest?

If you do not have Usenet access, but you do have Internet e-mail access, you can access this discussion group through the Info-Atari8 Digest.

The Info-Atari8 Digest originates from

mailto:info-atari8-request@pine.cse.nau.edu

Subscription requests should be sent to the above address with the subject:

SUBSCRIBE | UNSUBSCRIBE (that is, one or the other)

The first line of the body of the letter should be the person's full name followed by his/her mailing address. For example:

Mike Todd snyder10@convex1.tcs.tulane.edu

To contribute to discussion threads in the Info-Atari8 Digest, send your posting to mailto:comp-sys-atari-8bit@cs.utexas.edu. Postings sent here automatically appear on news:comp.sys.atari.8bit and in BITNET's INFO-A8.

Note that any posting sent to mailto:info-atari8@pine.cse.nau.edu
will NOT be cross-posted to the Usenet side. The Moderator is presently
working to correct this.

The Info-Atari8 Digest Moderator is:
Mike Todd, mailto:snyder10@convex1.TCS.Tulane.EDU

==========
3.2) What is INFO-A8?

If you do not have Usenet access, but you are on BITNET, you can access
this group through the INFO-A8 listserv. INFO-A8 is also accessible
through Internet e-mail.

The BITNET subscription commands are:

tell listserv at marist register <your real full name>
tell listserv at marist subscribe info-a8

The Internet subscription command is:
mailto:listerv@marist.bitnet, message says
subscribe info-a8 <your real full name>

This is not a standard BITNET mailing list. It is a distribution of the
Internet's Info-Atari8 Digest. In order to send mail to all of the
subscribers, both in BITNET and the other networks you should not send
your mail to the BITNET address (INFO-A8@MARIST,
(mailto:info-a8@marist.bitnet) but instead send to the Internet address
mailto:comp-sys-atari-8bit@cs.utexas.edu.

You may leave the list at any time by sending a "SIGNOFF INFO-A8" command
to LISTSERV@MARIST (or a message to mailto:listserv@marist.bitnet that
says "unsubscribe info-a8"). Please note that this command must NOT be
sent to the BITNET list address INFO-A8@MARIST
(mailto:info-a8@marist.bitnet) or to
mailto:comp-sys-atari-8bit@cs.utexas.edu, but to the LISTSERV address
LISTSERV@MARIST (mailto:listserv@marist.bitnet).

Contributions sent to this list are automatically archived. You can
obtain a list of the available archive files by sending an "INDEX
INFO-A8" command to LISTSERV@MARIST. These files can then be
retrieved by means of a "GET INFO-A8 filetype" command, or using the
database search facilities of LISTSERV. Send an "INFO DATABASE"
command for more information on the latter.

Please note that it is presently possible for anybody to determine
that you are signed up to the list through the use of the "REVIEW"
command, which returns the network address and name of all the
subscribers. If you do not wish your name to be available to others
in this fashion, just issue a "SET INFO-A8 CONCEAL" command to
LISTSERV@MARIST. More information on LISTSERV commands can be found
in the "General Introduction guide", which you can retrieve by sending
an "INFO GENINTRO" command to LISTSERV@MARIST.

The INFO-A8 maintainers (not moderators) are:
HARRY@MARIST (A Harry Williams)
mailto:RAVI@SPEEDY.MCNC.ORG (Ravi Subrahmanyan)
mailto:RAVI@MCNC.ORG (Ravi Subrahmanyan)
mailto:BILLW@SCORE.STANFORD.EDU (Bill Westfield)

INFO-A8 was created on December 9, 1986.

==========
3.3) How can I access the Merit/UMich Archive by e-mail?

Downloading - BART

Brode's Archive Retrieval Thang - the Merit/UMich Archive e-mail file server

To learn about using BART to access the Merit/UMich Archive, send
e-mail to: mailto:atari@atari.archive.umich.edu. The subject of the
message doesn't matter, but let the body of your message be:

help
send 8bit/0index

If you receive nothing within a day (it should take just a few minutes),
try including a line of this form:

path [your e-mail address]

BART automatically uuencodes binary files (so they may be mailed over the
Internet) and splits up large files into parts of about 30K or less.

Uploading

Simply uuencode the file, (please split it into parts of 60 K or less)
and mail the result to mailto:lenn@atari.archive.umich.edu. Please name
the parts in the subject line. This is really helpful as the parts
usually don't arrive in the proper sequence. Also, please include a
message labeled "file transmission," containing a short description of
the file, etc. Shar files are also acceptable, but uuencoded is preferred.

==========
3.4) How can I retrieve files from FTP sites by e-mail?

There are several general-purpose FTP mail-servers. These may be used to
retrieve any files available from anonymous FTP sites on the Internet.

1) mailto:ftpmail@decwrl.dec.com with no subject line, and two-line
body with line one help and line 2 quit

2) mailto:ftpmail@grasp.insa-lyon.fr (body: help) Please, European
users only.

3) mailto:bitftp@pucc.princeton.edu (body: help or ftplist for a
list of anonymous ftp sites)

4) mail BITFTP@DEARN or to mailto:BITFTP@vm.gmd.de (body: help or
ftplist for a list of anonymous ftp sites) (Europe only)

==========
3.5) How can I post to Usenet newsgroups by e-mail?

There are a several 'public' mail/News gateways. Each one has their own
ways for addressing syntax. The three most common ones are:

Site: cs.utexas.edu
Syntax: newsgroup-name@cs.utexas.edu
Example: To send to the newsgroup 'comp.sys.atari.8bit',
address the message to
comp-sys-atari-8bit@cs.utexas.edu

Site: newbase.cs.yale.edu
Syntax: newsgroup.name-news@newsbase.cs.yale.edu
Example: To send to the newsgroup 'comp.sys.atari.8bit',
address the message to
comp.sys.atari.8bit-news@newsbase.cs.yale.edu

Site: decwrl.dec.com
Syntax: newsgroup.name@decwrl.dec.com
Example: To send to the newsgroup 'comp.sys.atari.8bit',
address the message to
comp.sys.atari.8bit@decwrl.dec.com

Mail-to-news gateways of this sort tend to be overloaded.
Therefore, please do not use these gateways or any other similar
gateways if you can post to Usenet directly.

==========
4.1) How can I access the Merit/UMich Archive by FTP?

The Merit/University of Michigan Software Archives hold a huge number
of files for many computing platforms, including the Atari 8-bit
computers. Our 8-bit Atari Archivist is Jody Lenn,
mailto:lenn@atari.archive.umich.edu; the Atari Archive as a whole is
maintained by Mickey Boyd, mailto:boydm@atari.archive.umich.edu. The
best way to contact the Atari Archivists is
mailto:atari-archivists@atari.archive.umich.edu.

The convention for Anonymous FTP sites is to accept "anonymous" as your
user name, and your e-mail address as your password. All of the
following FTP sites follow this convention.

Downloading

(Try the site nearest you first)

a) ftp://atari.archive.umich.edu/atari/8bit
(141.211.120.11, United States)

b) ftp://wuarchive.wustl.edu/mirrors/archive.umich.edu/atari/8bit
(128.252.135.4, United States)

c) ftp://src.doc.ic.ac.uk/computing/systems/atari/umich/8bit
(146.169.2.10, Great Britain)

d)
ftp://info2.rus.uni-stuttgart.de/afs/umich.edu/group/itd/archive/atari/8bit
(129.69.8.13, Germany)

e) ftp://nic.switch.ch/mirror/atari/8bit
(130.59.1.40, Switzerland)

Remember to set file type to BINARY when downloading non-text files
(.arc, .com, .dcm, etc.) by FTP.

Uploading

Place uploads in:
ftp://atari.archive.umich.edu/atari/8bit/New
(141.211.120.11, United States)

No uploads may be made to the Archive's mirror sites.

Remember to set file type to BINARY when uploading non-text files
(.arc, .com, .dcm, etc.) by FTP. Also, please upload a short .text file
describing what your upload is, so our 8-Bit Archivist will be sure to place
it in an appropriate permanent directory.

Note that the atari/8bit/New directory is "write-only."

Newly uploaded items may be found in
ftp://atari.archive.umich.edu/atari/8bit/Newitems

==========
4.2) What is the Boston Archive?

Here's an 8-bit Atari FTP site located at Boston
University. It is maintained by Adam Bryant, mailto:adb@albert.bu.edu.

ftp://cs-ftp.bu.edu/PC/ATARI (128.197.13.20, United States)
(user name "anonymous"; password is your e-mail address)

==========
4.3) What is the PVV Archive?

This is an Atari FTP site maintained by Eyvind Bernhardsen,
mailto:eyvind@lise.unit.no. PVV stands for ProgramVareVerstedet, or The
Software Workshop, a student society at the University of Trondheim, Norway.

ftp://nova.pvv.unit.no/pub/Atari/8bit (129.241.36.207)
(user name "anonymous"; password is your e-mail address)

Uploads go to ftp://nova.pvv.unit.no/incoming/atari/8bit; Eyvind moves
them to the appropriate directory. Please include a .readme file with
each upload, so people know what they're downloading.

==========
4.4) What is the ClarkNet Archive?

This 8-bit Atari FTP site is maintained by Kevin Atkinson,
mailto:kevina@clark.net

ftp://ftp.clark.net/pub/atari
(user name "anonymous"; password is your e-mail address)

==========
5.1) What is the Cleveland Free-Net Atari SIG?

The Cleveland Free-Net is like a huge public bulletin board system, and it is the hub system of the NPTN, the National Public Telecomputing Network. Those persons with full Internet access can TELNET (this does not mean FTP) to telnet://freenet-in-a.cwru.edu, telnet://freenet-in-b.cwru.edu, or telnet://freenet-in-c.cwru.edu (129.22.8.32, 129.22.8.51). Applications for free accounts are handled online, or you may browse the system as a visitor. Once logged-in, type "go atari" to reach the Atari SIG. Those who add their names to the Atari SIG user directories are automatically members of the official Atari user group C.A.I.N. - Central Atari Information Network. Send correspondence and press releases to mailto:xx004@cleveland.freenet.edu. The Atari SIG's 8-Bit Computers Support Area is maintained by Michael Current, mailto:aa700@cleveland.freenet.edu, the 8-Bit Technical Forum is maintained by Craig Lisowski, mailto:aa853@cleveland.freenet.edu, and the Atari SIG Manager is Len Stys, mailto:aa399@cleveland.freenet.edu.

==========
5.2) What is the Youngstown Free-Net Atari SIG?

Youngstown Free-Net (Youngstown, Ohio USA)
telnet://visitor@yfn.ysu.edu (192.55.234.27)
Via Modem: 216/742-3072

Youngstown Free-Net Atari SIGOps:

Joe Perkins (mailto:ac742@yfn.ysu.edu)
Joe Sabatino (mailto:ab588@yfn.ysu.edu)

Atari SIG (mailto:xx140@yfn.ysu.edu)

==========
5.3) What is the National Capital Free-Net Atari SIG?

National Capital Free-Net (Ottawa, Canada)
telnet://guest@freenet.carleton.ca (134.117.1.25)
Via Modem: 613/780-3733

National Capital Free-Net Atari SIGOp:

Christopher Browne (mailto:aa454@Freenet.carleton.ca)

==========
6.1) How can I retrieve files from the Merit/UMich Archive through Gopher?

The Merit/UMich Archive has a native Gopher server. Try

gopher://gopher.archive.merit.edu:7055/11/atari/8bit

to connect directly to the Merit/UMich Archive's 8-bit Atari directory. I personally recommend this method for downloading from the Merit/UMich

Archive.

There is also a mirror archive site with a Gopher server:

gopher://src.doc.ic.ac.uk/11/computing/systems/atari/umich/8bit

==========
7.1) What is the Atari Classic Homepage?

Maintained by Eyvind Bernhardsen, mailto:eyvind@pvv.unit.no. Point your
Web client to:

http://www.pvv.unit.no/~eyvind/atari/

==========
7.2) What is the Atari 8-Bit Home Page?

Run by mailto:ipoorten@cs.vu.nl (Ivo van Poorten). The URL is:

http://www.cs.vu.nl/~ipoorten/8bit.html

==========
7.3) What is the Atari 8-Bit Resort?

This one is kept by mailto:un55@rz.uni-karlsruhe.de, Marek Tomczyk. URL:

http://rzstud1.rz.uni-karlsruhe.de/~un55/8bit.html

==========
7.4) What is the Big Atari 8bit Home Page?

This home page is kept by Tomasz Tatar, mailto:tatar@student.uci.agh.edu.pl

http://www.uci.agh.edu.pl/student/robo1grp/tatar/public_html/atari/hp.html

==========
7.5) How can I access the Merit/UMich Archive by AFS?

Downloading

Just cd /afs/umich.edu/group/itd/archive/atari/8bit
[What is the propsero:// URL for this?]

Uploading

Just cp the file into /afs/umich.edu/group/itd/archive/atari/8bit/New
[What is the propsero:// URL for this?]

==========
8.1) What print magazines support the 8-bit Atari?

Atari 8-Bit Alive

==========
8.3) What is the CAIN Newsletter?

The Central Atari Information Network Newsletter is the monthly online magazine of the Cleveland Free-Net Atari SIG. The editor is Mark Leair of the Atari SIG. 8-bit computers support is provided by Michael Current and Craig Lisowski. For information, write to the Atari SIG at xx004@cleveland.freenet.edu.

==========
9.1) What's this UUEncoding stuff (.uu, .uue files) all about?

UUEncode/UUdecode is a UNIX utility that will convert a binary file into 100% printable ASCII characters, so that the file may be posted or e-mailed anywhere a text message can go. The 8-bit Atari is perfectly capable of UUEncoding/UUdecoding as well. On the archives:

Uudecode 1.2a by John Sangster - very functional.
Merit/UMich: Archivers/uudecode.bas, Archivers/uudecode.doc
Boston: comm/uudecode.lst, comm/uudecode.doc

Yet Another UU-coder by John Dunning - both decoding/encoding.
Merit/UMich: Archivers/yau.arc
Boston: comm/yau.uue, comm/yaue.uue, comm/yau.doc

Uudecode.com, Uuencode.com by ??? - "newer, cleaner, easier to use."
Merit/UMich: Utilities/uue.arc

Dumas UU-coder by John Dunning - should work w/BART-style split files.
Merit/UMich: Cc65/dumasuu.arc

==========
9.2) What is an .arc file?

A file with the extender .arc has been archived in a standard manner that is common in the MS-DOS world. This is done to make the file shorter, so it takes up less space on your disk and it takes less time to transfer between computers. The archives contains several 8-bit Atari archivers fully compatible with this standard, including:

Super Un-Arc 2.3, Super Arc 2.0 by Bob Puff - highly recommended.
Merit/UMich: Archivers/superarc.arc - both Super Un-Arc & Super Arc
Archivers/suprarc2.arc - Super Arc
Archivers/supunarc.com - Super Un-Arc
Archivers/supunarc.uue - Super Un-Arc
Boston: {comm,util}/superarc.uue, {comm,util}/superarc.doc

==
9.3) Okay, how about a .dcm file?

A .dcm file is a format unique to the 8-bit Atari which is used to convert
entire disk images into files. To work with .dcm files you'll need:

Disk Communicator 3.2 by Bob Puff.
Merit/UMich: Archivers/dskcom32.arc or Archivers/diskcomm.arc (same thing!)
Boston: {util,comm}/diskcomm.uue

==
10.1) What 8-bit Atari emulators exist for other computing platforms?

These are the emulators that are usable.

1) ST Xformer 2.55, from Branch Always Software
a freeware 8-bit Atari emulator for the Atari ST.
Merit/UMich: /atari/Emulators/stxf255.lzh

2) PC Xformer 2.0, from Branch Always Software
a freeware 8-bit Atari emulator for DOS/Windows/OS/2.
Merit/UMich: Xf2/xf2.zip
ClarkNet: /systems/msdos/emulators/xf2.zip

==
11.1) What are the best telecommunications programs available?

Here are some of the more popular PD/shareware terminal programs
available on the archives:

BobTerm, shareware by Bob Puff
Emulates: VT52
Text: 40 columns in gr.0; 80 col. w/ XEP80
File Xfer: XMODEM, YMODEM, FMODEM
Autodial: Yes
Archive filename:
ftp://atari.archive.umich.edu/atari/8bit/Telecomm/bterm12.arc

Kermit-65, public domain by John Dunning
Emulates: VT100
Text: 40 columns in gr.0; 80 col. in gr.8; 80 col. w/ XEP80 (sort of)
File Xfer: Kermit
Autodial: No
Archive filenames:
ftp://atari.archive.umich.edu/atari/8bit/Telecomm/k65v37.arc - latest version
ftp://atari.archive.umich.edu/atari/8bit/Telecomm/k65doc.arc - documentation
ftp://atari.archive.umich.edu/atari/8bit/Telecomm/k65src.arc - source code

OmniCom by CDY Consulting
Emulates: VT100
Text: 80 columns in gr.8
File Xfer: XMODEM, Kermit
Autodial: No
Archive filename:
ftp://atari.archive.umich.edu/atari/8bit/Telecomm/omnicom.arc

VT850, shareware by Curtis Laser
Emulates: VT100/VT102 (plus complete VT220 keymap)
Text: 40 columns in gr.0; 80 col. w/ XEP80
File Xfer: none
Autodial: No
Archive filename:
ftp://atari.archive.umich.edu/atari/8bit/Telecomm/vt850b1.arc

[to add: FlickerTerm 80 by LonerSoft; Ice-T by IceSoft]

==========
11.2) Can I read/write 8-bit Atari disks on an IBM-PC?

There are several programs on the archives of this variety. Note
that these require a DOS and disk drive on the Atari end capable of the SS/DD
180K format (SpartaDOS, MYDOS, etc.; XF551, Indus GT, etc.). The programs are:

ATARIO by Dave Brandman w/ Kevin White - Reads SS/DD 180K Atari disks.
Merit/UMich: Diskutils/atario21.arc

SpartaRead by Oscar Fowler - Reads SS/DD 180K SpartaDOS disks.
Merit/UMich: Diskutils/sr.arc

UTIL by Charles Marslett - Reads/Writes SS/DD 180K Atari disks. See MyUTIL.
Merit/UMich: Diskutils/dskutil.arc
(Older versions are contained in pcxfer.arc, util.arc, and ataridsk.arc)

MyUTIL by Charles Marslett and Mark Vallevand - Try this one first!
Merit/UMich: Diskutils/myutil.zip
PVV: utilities/disk/myutil.zip

==========
11.3) Can I read/write DOS disks on an 8-bit Atari?

If your highest-capacity floppy drive on your Atari system is the
Atari 1050, you won't be able to use ATARIO, SpartaRead, or UTIL. You
still have the following alternative:

Mule by Rick Cortese - Read/Write 180K MS-DOS disks with an Atari 1050
drive or equivalent. Very limited.
Merit/UMich: Diskutils/mule.arc, Diskutils/mule.exe, Diskutils/mule.txt

==========
11.4) How do I transfer files using a null modem cable?

This section by mailto:cb541@cleveland.Freenet.Edu (James R. Gilbert)

A: Simply put, you need a terminal program and an RS 232 port on
each computer. The RS 232 ports need to be connected
together using a 'null modem cable'.

For up to 4800 bps, no flow control lines need be
connected. Just cross the transmit and receive lines
and join the grounds together. (Transmit is pin #2,
receive is pin #3 and ground is pin #7 on the 25-pin
port.)

The right hand pin on the 'long' side of a female 'D' connector is #1. There are 13 holes on this 'long' side, 12 holes on the 'short' side. The numbers go from #1 on the right to #13 on the left on the 'long' side and from #14 to #25 from right to left on the 'short' side. #25 is closest to being under #13. A male connector is the mirror image of this.

Most terminal programs allow a null connection, without a carrier detect. Notably, '850 Express!' does not.

A convenient way to make a null modem cable, up to about 30 feet long, is to use two female DB25 connectors and some three or more conductor cable. Using the two DB25 female connectors allows unplugging your modem and plugging in the null modem cable. This also avoids the confusion of the wide variety of serial port jacks on different computers. Almost all computers connect into the modem via a DB25 connection.

The SIO port on the Atari cannot be used directly. An 850 Interface Module, P:R:Connection, Multi I/O, Black Box (by Computer Software Services) or similar device that provides an RS232 port must be used.

On the Atari, the port is a female DB9. So you need a male DB9 to male DB25 modem cable to connect to your modem. So why not use this cable as your null modem cable as well?

For higher speed connections, above about 9600 bps on the 8-bit, you need the flow control lines. You also need a Multi I/O or Black Box, which use the PBI (parallel bus), then you can go higher than 9600 bps.

Following are pin assignments for a DB25 pin RS 232 C port.

(Above is female, male is mirror image.)

1. Protective Ground 12. Select Alternate Rate
2. Transmit Data 15. Transmit Clock (sync)
3. Receive Data 17. Receive clock (sync)
4. RTS (Request to Send) 20. Data Terminal Ready
5. CTS (Clear to Send) 22. Ring indicator
6. Data Set Ready 23. Select Alternate Rate
7. Signal Ground 24. Transmit Clock
8. Carrier Detect

A high speed cable would need not only pins 2 and 3 crossed
but also pins 4 and 5 as well as 6 and 8. Or better
yet, make a true 25 wire, straight through cable and use
a commercial null modem. A commercial null modem is
just a small device with the correct lines already
crossed.

(DTE = Data Terminal Equipment, i.e., your computer.
DCE = Data Communications Equipment, i.e., your modem.)

==
12.1) What 5.25" floppy disk drives are available?

TOMS 720 DS SD/ED/DD 70000 bps, includes parallel
80-track 720 KB Centronics port,
PC's 180/360 KB
AS SN-360 DS SD/ED/DD 19200 bps
TOMS 710 DS SD/ED/DD 70000 bps
80-track 720 KB
PC's 180/360 KB
LDW 2000 SS SD/ED?/DD? 19200 bps
LDW CA-2001 SS SD/DD up to 38000 bps
ED w/troubles
LDW CA-2002 DS SD/ED?/DD up to 38000 bps
with SpartaDOS 70000 bps

Detailed descriptions of the TOMS 720, SN-360, TOMS 710, LDW 2000,
CA-2001 and CA-2002:

1. TOMS 720
double head disk drive, 5.25", with mounted interface Centronics,
chips: CPU 8085, WD2797, PIA 8255 (for handle Centronics), 32 KB ROM, 8 KB RAM
ROM contains: OS of drive, MYDOS 4.50 and some utilities (copy, format, etc.)
ROM is seen by computer as drive D1: (if drive is open), and D3: (when drive
has number D1:) or D4: (when drive has number D2:). It makes possible load DOS
from ROMdisk during booting system.
Formats of disks:
- SS/SD - 40 tracks, 18 sects, 128 bytes = 90 KB
- SS/ED - 40 tracks, 26 sects, 128 bytes = 130 KB
- SS/ED - 40 tracks, 18 sects, 256 bytes = 180 KB
- SS/ID - IBM S-9 - 40 tracks, 9 sects, 512 bytes = 180 KB
- DS/DD - 40 tracks, 18 sects, 256 bytes = 360 KB
- DS/QD - 80 tracks, 18 sects, 256 bytes = 720 KB
- DS/ID - IBM D-9 - 40 tracks, 9 sects, 512 bytes = 360 KB
Transmition modes:
- normal - 19200 bps
- Turbo - 70000 bps
- Ultra Speed - 70000 bps
Also tracks buffering.

2. SN-360
double head disk drive, 5.25", CPU 8051, controler WD2797
19200 bps
Available formats:
- SS/SD - (FM) single sided, single density - 90 KB
- SS/ED - (MFM) single sided, enhanced density - 130 KB
- SS/DD - (MFM) single sided, double density - 180 KB
- DS/DD - (MFM) double sided, double density - 360 KB

3. TOMS 710
(The newest polish disk drive and probably the best one)
Similar to TOMS 720, one more format:
- double sided, 80 tracks, IBM (720 KB)
Transmition modes:
- standard 19200 bps
- TOMS Turbo (loaded from ROMdisk if drive is open) - 67000 bps
- Ultra Speed (QMEG-OS, Sparta DOS) - 67000 bps
Also tracks buffering.
ROMdisk contain:
- MYDOS 4.50
- COPY
- INIT
- TURBO - turn on/off TOMS Turbo mode
- BASIC - turn on/off Atari Basic
- AUTORUN.SYS - ramdisk
- README
Also TOMS Navigator instead of DUP.SYS. It is program similar to Norton
Commander on PCs.
IBM-ST copier on additional disk.

4. LDW Super 2000
single head, 5.25", CPU Z80A, ROM 4 KB, RAM 256 B
Transmition: 19200 bps or 38000 bps
Formats:
- SS/SD - 90 KB
- SS/ED - 130 KB (with some troubles)
- SS/DD - 180 KB

5. CA-2001
single head, 5.25", CPU Z80A, ROM 4 KB, RAM 256 B
Transmition: 19200 bps or 38000 bps
Formats:
- SS/SD - 90 KB
- SS/ED - 130 KB (with some troubles)
- SS/DD - 180 KB

6. CA-2002
double head, 5.25", CPU 8040, ROM 4 KB, RAM 256 B
Transmition: 19200 bps (70000 with Sparta DOS)
Formats:
- SS/SD - 90 KB
- SS/ED - 130 KB
- SS/DD - 180 KB
- DS/DD - 360 KB

Floppy board various Any standard very fast parallel
DOS-transparent
Requires Black Box
DS system configurable for
XF Percom or ATR style
HDI various Any standard very fast SIO? European

SWP ATR-8000 Any standard standard
except 1.2 and unique DS system
1.44 meg (HD)
nice Z80 CP/M system in which CP/M drive
acccess is parallel only thus faster.
Atari 1450XLD drives DS SD/ED DD? standard, requires DOS4
unusual DS system
Only prototypes exist
Atari XF521 3.5" system Unreleased

==========
12.2) How can I use 3.5" floppy disks with my 8-bit Atari?

to be written. volunteers?

==========
12.3) What do I need to connect a hard drive to my 8-bit Atari?

original by mailto:Krishna@max.tiac.net (Glenn M. Saunders)

Corvus ? 10 megabytes Fast but still relatively
slow I/O, kludge through
joystick ports for 800.
Rare
Supra/K-P N/A various Some limitations on drive
type and size and total
number of drives in sys.
FTe Multi I/O various 256 byter per sector
restriction. 256K and
1 meg ramdisk models.
Printer and modem, modem
will handle 19.2K bps
CSS Black Box various Will handle all SCSI drives.
Allows 9 drive access for
MYDOS. Currently the only
modem interface with CTS/RTS
hardware flow control. 19.2K
ready.
SWP ATR-8000 unknown limits Rare daughterboard for hard
drives. I/O is probably
fairly slow on this baby and
there may be DOS restrictions.

==========
12.4) How can I use an IBM-PC as a storage device for my Atari?

Original by Dave Paterson, mailto:d.paterson2@genie.geis.com

SIO2PC is a cable and software combination that lets you use your PC as up
to 4 drives for your 8-bit. Drives can be SD, ED, DD or custom sizes up to
16 megs. SIO2PC also lets you redirect the printer output to your PC
printer or to a file on the PC. High speed drives are emulated (a la US
Doubler).

All these functions are transparent at the Atari end; you never notice the difference between SIO2PC and regular drives, except that the SIO2PC drives are faster than any others (except Ramdisks and PBI interface drives).

SIO2PC 3.19i is shareware by Nick Kennedy.
Merit/UMich: Sio2pc/sio319i.exe

==========
13.1) What's the best DOS for the Atari?

This is a matter of opinion, but general consensus is that all 8-bit Atari users should treat themselves to either MYDOS or SpartaDOS to appreciate the power of the system. MYDOS is modelled after Atari DOS 2.0S/2.5, but provides subdirectory and hard-drive support. SpartaDOS is a completely different command-line DOS modelled after MS-DOS, though it is perfectly capable of reading all Atari DOS and MYDOS disks. SpartaDOS 3.2g is disk-based; SpartaDOS X 4.21 is cartridge-based and includes many additional features. SpartaDOS is available from Fine Tooned Engineering (see companion vendor/ developer list); MYDOS 4.53 is freeware from Wordmark Systems (Charles Marslett and Bob Puff).
It is recommended that all 8-bit Atari users own at least DOS 2.5 for complete compatibility with existing software, and then choose either SpartaDOS or MYDOS as they see fit. DOS 2.5, MYDOS and SpartaDOS are all available on the archives.
Merit/UMich: Fte/fte32g.arc (SpartaDOS)
Merit/UMich: Os/mydos453.dcm (MYDOS)

==========
13.2) What hardware has Atari created in the 8-bit computer line?

Computers:
400 Personal Computer (1979) 8-16K, membrane keyboard, 400/800 OS
800 Personal Computer (1979) 8-48K, two cartridge slots, 400/800 OS
1200XL Home Computer (1982) 64K, early XL OS, F1-F4 keys, 4 LEDs
600XL Home Computer (1983) 16-64K, BASIC, PBI, XL OS
800XL Home Computer (1983) 64K, BASIC, PBI, XL OS
800XE Home Computer (1987?)same as 130XE but 64K. Mostly eastern Europe.
65XE Personal Computer (1985) same as 800XL minus PBI
130XE Personal Computer(1985) same as 65XE with 128K plus ECI
XE Game System (1987) same as 65XE plus Missle Command, detach keybd

Peripherals:
410 Program Recorder -Japan and Hong Kong versions
810 Disk Drive -SS/SD 90K with DOS 1 or DOS 2.0S,MPI&Tandon vers.
820 Printer -40 col.
822 Thermal Printer -40 col.
825 80-Column Printer -req. 850
830 Acoustic Modem -300 baud req. 850, with Telelink I
835 Direct Connect Modem -300 baud, with Telelink II
850 Interface Module -4 9-pin serial, 1 15-pin parallel ports, beige & black metal versions
1010 Program Recorder -Sanyo and Chelco versions
1020 Color Printer -40 col., print/plot in 4 colors

1025 80-Column Printer -7-pin dot matrix
1027 Letter-Quality Printer-80 col., letter quality
1029 Printer -7-pin dot matrix, same as Commodore MPS-801
1030 Direct Connect Modem -300 baud, with ModemLink
1050 Disk Drive -SS/ED 128K with DOS 3 or DOS 2.5
1064 -64K RAM module for 600XL
XC11 Program Recorder
XC12 Program Recorder
XM301 Modem -300 baud, with XE Term
XMM801 Printer -80 col.
XDM121 Printer -80 col., letter quality
XF551 Disk Drive -DS/DD 360K with DOS XE
XEP80 Interface Module -80 col. video display and DB25 parallel port
SX212 Modem -1200 baud, rarely with SX-Express! package

Atari 8-bit vaporware computers: (note some are more vaporous than others)
1200 1200XL internally, many slight cosmetic differences
800XLF 800XL incorporating a FREDDY chip (as in the XE's)
1250XLD Earlier concept of the 1450XLD
1400XL 800XL plus modem, speech synth.(looks like a 1200XL)
1450XL Earlier concept of the 1450XLD
1450XLD 1400XL plus 5.25" floppy drive
65XEP 65XE plus 3.5" floppy drive, 5" green monitor
65XEM 65XE plus AMIE sound chip

Atari 8-bit vaporware peripherals:(note some are more vaporous than others)
815 Dual Disk Drive -2 x SS/DD 180K with DOS 2.0D
1090 XL Expansion System-for PBI, CP/M/MS-DOS/Apple II compatible
XM128 -12" green monitor w/ built-in 80-column card
XC1411 -composite 14" color monitor
XF521 -5.25" floppy drive - 1050 compatible, in XE style
XTM201 -non-impact printer
XTC201 -non-impact color printer

==========
13.3) What are the power-supply requirements for my Atari components?

Please let me know if any of this information conflicts with the units
you have!

The most important information is the voltage (in volts) required, and
whether you need a transformer (AC output) or an adapter (DC output). The
power (in watts) and current (in amperes) specifications of the original
equipment as presented here should be regarded as minimum values.
Higher-than-specified power and current capacities are entirely usable,
and often preferable because such supplies run cooler and last longer.

Power (in watts) = current (in amps) * voltage (in volts)

9 V AC 5.4 VA (600 mA) Atari#CO62195 transformer:
1030

9 V AC ???? VA (??? A) Atari#CO61516 transformer:
1010

FTe Guys:

Can you tell me if it's possible to make a Miniscribe 8425S (20 meg SCSI) to work on an original MIO? Is it the formatter that doesn't support it? If I can format the drive on another system (say, an ST) to 256-byte sectors, will it work? Any chance you could add support to the formatter for the drive?

Rob

: The MIO II has been codenamed the "Pocket MIO", because
: it's very small. (and very cool)

What is the upper limit as far as capacity goes? Are these going to be limited to 528MB like the original IDE, or are the more insane of us going to be able to attach larger hard drives to it? How will it handle partitions?

Jason

KK> no idea how it happened.

It's been a year or so since I last tried Mega-Blast I. If I remember correctly, at various intervals in the game, the game world creates "super objects" in between the "tippy mirrors". These super objects are things like green donuts, stars etc. The super objects can be beneficial or harmful. Some of the powers that shooting a super object can bestow are: double cannon rapid-fire, energy absorption shot invulnerability, and a couple of others that I forget. I think you turn violet or something when you are invulnerable. The super powers do not last forever. There is a horizontal "power bar" thermometer that melts away right-to-left(?) at the top of the screen. When the bar melts away you have a normal ship again. A neat trick is that some of the super objects placed on the board are actually disguised "ricochet traps" instead. When you open up on one of these, your deadly fire is reflected right back upon you. There is a "code word" to get you into the MEGA-BLAST I options "set up" menu. I vaguely remember it as being a variant on the word "fun", such as "havefun". Hopefully someone here will remember what it is. That is all that I know off the top of my head. I can get the game out and try it again if you think that will be of any help. (Oh yes... the setup menu has its own music, which is different than the other music used in the game. I can't hear the "sampled, digital" music on my 64K machine, but the computer techno-pop is still quite good, even with pure tones instead of sampled waveforms.)

Jason D. Bardis (jasonbar@ramp.ucsb.edu) wrote:

: Just found a 600xl ($3 at a thrift store).
: How do I disable
: BASIC to run non-BASIC disks?

Simple- when you switch on the machine, you must hold down OPTION. This switches out the BASIC ROM and is similar to having a 400/800 model without the cart inserted. As far as I know, having another cart inserted will also disable BASIC Really though, if you want to boot a program which doesn't like BASIC hold down option, in addition to any other keys (ie START) when you switch on. This works on any XL/XE (except the rare 1200XL- I think).

Double your Freezer capacity- defrost it today!!!

5534. PLEASE! Restrict posts to 80 columns!

Newsgroup: comp.sys.atari.8bit
Date: 1994-09-30 15:27:01 UTC
From: hutch@ilmen.lanl.gov
Message-ID: <9409301416.AA07248@ilmen.lanl.gov>
Source record: 98107
Cross-posted to: comp.sys.atari.8bit,comp.sys.atari.st,comp.sys.atari.st.tech

Just a request here on behalf of many who slog their way through the
Atari newsgroups every day on the Usenet and other online services:

PLEASE... when you post a message to ANY newsgroup on the Usenet, keep
your messages to a width of 80 columns or less and use a hard carriage
return at the end of each line. That means no lines longer than this:

0--------1---------2---------3---------4---------5---------6---------7--------8

A lot of folks have been merrily typing away, entering a huge post and
never pressing the RETURN key. This has an adverse effect in two ways:

1) It makes your post extremely hard to read from most newsreaders and
impossible to read from some of them (and doesn't reflect very well
on you as the sender, either);

and

2) It makes your post a likely candidate for being deleted from the
queue of those posts that get echoed (relayed) to other online
telecomm services. No one wants to manually clean up such posts so
the simple solution is to just delete them. Zap!

Remember, not all newsreaders are created equal. So be thoughtful and
take just a moment to properly format your posts. And would it be too
much to ask folks to stop using those darn HUGE sigs? Yeh, thought so. :)

Cheers,

-Hutch- @ Fair Dinkum Tech

5535. Multi-player games before 1983?

Newsgroup: comp.sys.atari.8bit

From: kowalski@access.digex.net
Message-ID: <36h62e$cn7@news1.digex.net>
Source record: 98113

I am doing research on the history of video games and am curious to find if anyone knows of multi-player games that existed before 1983.

The game should allow two players to play each other in a way where the two players are not looking at the same screen, but they may see the other player on their screen. They may be connected through modem, over network, or whatever...

Any clues?

Rob Kowalski
kowalski@access.digex.net

All things considered, IDE drives are less expensive then scuzzy, have
10 times the data transfer rate of an MFM or RLL drive, & don't require
you to buy a scuzzy to MFM board like the Adaptec. IMO: Not a bad choice.
Rick

5537. percom drives

Newsgroup: comp.sys.atari.8bit
Date: 1994-09-30 18:39:35 UTC
From: amszorny@mtu.edu
Message-ID: <199409301839.OAA04115@mtu.edu>
Source record: 98114

Well, I opened the drive up to look for some dip switches but found nothing. Maybe this drive is a cheaper model. I does have the printer port and what looks to be a connector for another drive. The problem is the power supply first goes to the controller board which then powers the drive mechanism and there's only 1 connector for a drive. There is space and mounting holes for another 1/2 height floppy though. It is pretty strange that there isn't even a switch for setting the unit as drive 1 or 2. I think I'm gonna give up for now. If someone has a double density drive to sell (such as an Indus or something like that) I might be interested.

Thanks,
Andy

I believe that on Percom drives you set the drive number by moving the drive select jumper on the drive board. There should be some pins marked DS0, DS1, DS2, DS3 near the edge connector. One of these pairs of pins should have a jumper between them. And Radio Shack sells Y-connectors for standard disk drive power plugs.

Some of them can't be adjusted. The Percom I was setting up for a friend is an RFD in which 2 of the four dip switches determine what the first physical mech will appear as, D1-4. This is different from their controller ID of course. Any additional drives would thus go up from there. Like a Percom with 4 drives with the dip switches set so that the first one is D4 would go in sequence, D4, 5, 6, and 7.

IMHO the XF-551 is the best double density drive and if one is going to be stuck with only floppies, the dual 720/360K system is really choice because you also gain the ability to read/write MS-DOS format disks in a common format (3.5" 720 rather than 360 or 180K 5.25"). Many computers these days don't even have 5.25" drives. But as long as you can do 3.5" MS-DOS you can pretty much share files with anybody. MACs and AMIGAs and workstations like Sparcs can read/write MS-DOS using various means. You'd never have to set up a null-modem again.

Man, I bet none of those were ever released. All of them sound neat. The quality of
the materials in the too kits I have is EXCELLENT. I'm really surprised that this
stuff wasn't more popular with families. We're planning to do school projects around
it.

>What is the upper limit as far as capacity goes? Are these going to be
>limited to 528MB like the original IDE, or are the more insane of us going to
>be able to attach larger hard drives to it? How will it handle partitions?

As it sits right now, it looks like it will initially only support
9 partitions... This is the economy version remember. <g>

There are quite a few of us who are insane though, and my only limitation
right now is 24 hours a day. Let's see what the response is to the
MIO II in it's current form, and that will determine what FTe REALLY
does in the next 6 months or so.

As far as "so much for the Multi" in the name. We prefer to think
of it as the "Mini I/O"

Just to throw another two cents' worth of gasoline onto the fire...

A friend of mine here says, "T:EDIT doesn't _HAVE_ any docs! I typed it in out of the magazine myself!"

He adds that, "the magazine might have included some instructions on how to use it, but those would be the only docs I'm aware of." I guess that would be "docs" in a sense, right? But there's probably a lot more to the program than could be covered in detail in a single magazine article....

Absolutely. The AtariLab modules were very well done.
It is amazing that the Atari products of the XL era were so well done,
considering the chaos the company was in at the time. :)

I'm glad to hear someone is going to do school projects with the existing
modules. They certainly deserve to be used.

An IDE adaptor for the Atari 8-bits certainly interests me. While I
would not be in the market for a version that can handle more than 528 MB
if that came at a premium, I certainly am willing to pay for an IDE adaptor
that handles up to 528 MB.

5549. XF551 Problems

Newsgroup: comp.sys.atari.8bit
Date: 1994-10-02 01:56:10 UTC
From: b.poehland@genie.geis.com
Message-ID: <199410020155.AA023112955@relay2.geis.com>
Source record: 98129

<Jeff Potter described how replacing a filter cap solved a heat problem
in an errant XF551.>

Hmmmm.... if replacing a filter cap in an overheating 551 solved the
problem, I reckon I can't argue with success!

Very frustrating, tho. It would have been nice to see before-&-after
measurements of ripple on the +5V bus, so there would be some logical
correlation to make for why the repair worked. Come to think of it,
I'm not sure just how much ripple a regulator will pass before it will
just blow up.

A few years ago I had a Type II supply that developed a bad cap.
This is original supply for the 600XL, but I was running a souped-up
800XL off it. The filter cap was 6800uF, & it went bad. I mean
REALLY bad, with juices leaking out of it, blecccch! The failure
developed over a period of perhaps a couple weeks. I first noticed
something was wrong because I started getting hum bars in my video
display. After a couple weeks the hum bars were so bad I couldn't see
the display. I found the power supply problem only after checking
out the computer & monitor first. I'm thinking there musta been a
helluva lotta ripple for the video to get wiped out. Yet the ripple
didn't affect the digital circuits or blow up the regulator. So I
guess anything is possible.

Little mysteries like this, where repairs work without folks knowing
exactly why, really bug the dickens outta me.

Oh yeah, I put in a 10,000uF cap & everything has been fine since.

Message-ID: <199410020156.AA023782990@relay2.geis.com>
Source record: 98130

I think I agree with Glenn's assessment of video performance in the various 8-bits. And yes, the 400 only has an RF output, it do suck.

I recently acquired an 800 & would have to concur that its video performance is pretty decent (mono, anyway; I didn't mess w/color yet). It does have the problem of color clock leakage into the mono, but the mono itself looks pretty clean.

Maybe one of these days after I've finished dealing with those hoodlums in Ann Arbor who passed bad checks to 20 of AC's former subscribers, I'll find time to extract the circuits in the 800 & see what's really going on in there. The 800's video circuitry is rather complex, unlike any of the circuits in the XL/XE machines.

5551. BIG BIG BIG AUCTION

Newsgroup: comp.sys.atari.8bit
Date: 1994-10-02 03:29:51 UTC
From: jasonbar@bolt.ucsb.edu
Message-ID: <36l9ff$bt0@bolt.ucsb.edu>
Source record: 98132

I'm doing an auction of various video game stuff in rec.games.video.
marketplace, under the subject heading of BIG BIG BIG AUCTION.
Below are the items relevant to this group's interests. Please go to
r.g.v.m for more info. Thanks.

BIG BIG BIG AUCTION--NEARLY--EVERY-SYSTEM-REPRESENTED!-------
----

Boring technicalities and specifics of how auction is run:---
----
- All this stuff is up for bids. I will continue taking bids on
items until bids for those items slow down or stop. Hot items
(NES ROB and PowerGlove, probably) will most likely stay available
longer than other, more common items (Atari Pac-Man carts, for
example).
- $1 increments only on bids, please.
- Send bids to me via e-mail at jasonbar@engineering.ucsb.edu.
- I will post updates to rec.games.video.marketplace _only_.
Look in that group _only_, even though I am posting an initial
announcement in several groups. Updates will show the current
highest bid and name of that bidder (so you can double-check in
case I miss an offer).
- Shipping will be an estimate of whatever mode is cheapest,
unless buyer requests otherwise. Would prefer to ship only to US
addresses, unless you are really serious.
- I am interested in trades as well as $. Do not be afraid to bid
a trade on an item whose listed high bid is a $ bid, or vice
versa. E-mail me specific trade offers (I do not have any lists
of what I own). Things I am looking for in trades (in
alphabetical order, not order of preference):
3DO software
Arcade game PCBs and accessories
Atari 2600 carts
Package system of Atari 5200 or 7800 (console + all cables &
controllers + carts)
Atari 8-bit computer software (no tapes)
Intellivision carts
Intellivision console
Mac software (incl. CD-ROMs) + hardware
Vectrex overlays

SOFTWARE/CARTRIDGES-------------------------

---Atari 8-bit comptuer software:---
Atariwriter (Atari, cartridge, box + manual, works)
Atariwriter Plus (accesses 130xe expanded memory, works w/ 65xe,
800xl, 800, 1200xl) w/ Atari Proofreader Dictionary Disk
(Atari, 2 disks, box + manual, works)
Juno First (DataSoft, tape, cannot test)
Koalapainter (koala, cartridge, needs koala pad)
More! Graphics for the Print Shop (Pierstorff, disk, cannnot test-
-my Print Shop is dead)
Polycalc (APX, tape, cannot test)

---Atari 8-bit books:---
Atari 400/800 Disk Guide
ACE Pocket Reference Card

HARDWARE---

---8-bit Atari computer:---
Atari 600XL (no cables, works)
Atari 850 Interface (power pack, works)
Atari 1030 Modem w/ ring detector that plugs in joystick port used
for BBS phone-answering (power pack, works)
Atari Daisy Chain cable (hook up disk drives, modem)
Atari Daisy Chain cable (hook up disk drives, modem)
C. Itoh Prowriter dot-matrix printer (works, power cable, 3 black
ribbons, 1 red ribbon, interface cable for Atari 850 interface)

James King tells us that the former editor of ANALOG tells him that all ANALOG software is now in the public domain. Where and when was an announcement to this effect publicly released? I won't be convinced until I see the public statement.

Russ Gilbert was kind enough to paraphrase the policy statement present in SOME issues:

In a previous article, Russ.Gilbert@apk.wariat.org (Russ Gilbert) says:

>Following is a quote from the official 'Permissions' part of one of my
>ANALOGs. I always found it confusing, but it was generally accepted
>that it meant that programs not forbidding it could be freely
>distributed after the month of publication. Now, Larry Flynt took the
>'Permissions' statement out after he took over.

I don't know when that was, but note that whatever this policy statement is supposed to mean, it doesn't apply to all issues.

>"No portion .. may be reproduced in any form..... Many programs are
>copyrighted and not public domain.

I'm guessing the "no portion" is referring to the print itself? Otherwise that's a very limiting statement on the programs they published.

> Due ... to many requests from Atari club libraries and bulletin
>board.... our new policy allows club libraries and individually-run
>BBSes to make certain programs from ANALOG available durint the month
>printed on that issue's cover. For example, software from the July
>issue can be made available July 1.

Then when that month is over, the programs are no longer to be distributed?

> This does not apply to programs which specifically state that they
>are not public domain and, thus, are not for public distribution.

What about copyrighted programs that ARE for public distribution: freeware and shareware?

> In addition, any programs used must state that they are from ANALOG

For any programs in the public domain, they can't make such a requirement since by definition there is no owner of public domain programs.

Obviously I'm not attacking Russ, I'm pointing out serious ambiguities in their former policy.

To James King: I would really appreciate it, and I think it would be helpful for everyone, if you could ask the former ANALOG editor where the

statement releasing all ANALOG software into the public domain may be found. I consider this a serious issue to be resolved.

I am so tired of the unending debate over whether Analog / Antic stuff is PD or not. Sysops have treated them that way for aeons and there has never been any litigation against them. Whether you decide not to upload or pass around the files won't change the fact that all that stuff is probably THE most available software for the Atari 8-bit.

William Kendrick (kendrick@zippy.sonoma.edu) wrote:
: Ben.. is the 800's video more complex than the 1200xl's? (Didn't I once hear
: you saying that the 1200xl's is a real circuit-overkill?) :)

The 800 reflects late 1978-era archetecture design. Everything about it is more complex than the later machines. As time went on, motherboards naturally got more and more compressed and more complex chips took over the responsibilities that a ton of resistors and capacitors used to do.

For instance, the 800 uses a relatively stock 6502 and buffers it with chips around it. The 6502C in the XL/XEs eliminated the need for the external buffering. And also the memory modules in the 800 reflected the low-capacity memory which was what was available then as opposed to the 8 chips in the XL or the 2 chips in the XEGS which add up to 64K.

It would only be logical to assume that the video circuitry would also be more complex than need be, but would have made sense for the era.

These days there are a great many specialized VLSI chips available. I was in radio shack and I saw a 'voice digitizer' chip up on the rack for $15. This little bugger has the A/D circuitry and onboard memory all built into it.

It is this kind of new technology which has given FTE the opportunity to build new hacks for the Atari's easily and avoid having to hand-engineer custom chips.

(M.Current, J.King., G.Saunders discuss Antic and ANALOG copyrights.)
Mr. Current is looking for an official public release of these two magazines from copyright prohibition of passing programs and typed in parts or whole of articles from the magazines. I don't think that is going to happen. The way I worked it when I had a bbs was to put Antic and ANALOG programs up for download. My concept wass that a person did not have to type the program in if he/she owned the magazine. It's my interpretation of the copyright law. Antic wanted you to either type it in yourself or buy a disk from them. I don't think that even if it came to a court case, which it never would, that Antic could win their concept of if you don't type it in yourself, you can't give/receive it. I am of the opinion that if you have the magazine, you are entitled to a copy of the programs in the magazine, you already paid for them. As far as ANALOG, probably it is confusing the issue that L. Flynt did not allow copyright infringement, but earlier ANALOGs did allow passing around of their programs. Mr. Flynt probably still owns the rights to all ANALOGs.
The making of 'certain' programs available on 'July 1' of the month of the issue was because the magazine was supposed to come out before the month printed on the cover. No, it isn't available for one month and then not available.

Source record: 98139

Hi Everyone,

Today I picked up a used 65XE, power supply and tape deck for 3 UK pounds! Half of the keyboard was dead, but a quick hack of the transparent membrane has cured that, and now it's fully working. Some questions you may be able to help me with:

1 - Is there a FAQ for this newsgroup?

2 - Am I right in thinking I would need an extra interface to be able to hook the 65XE up to my Atari ST to transfer files across via a null modem cable?

3 - I've seen lots of 8bit software on ftp sites, and presuming I retrieved this using my ST and ported it over, would I be able to dearchive and use any of this with cassette, or do I really need a disk drive (I'm told the drives are very rare here in the UK)?

I'll be avidly awaiting any replies. I'm actually a journalist in the 16bit ST world, but this is the 1st time I've used one of the old Atari 8bit micros, though I yearned for one for years when I was a Spectrum user :-)

Cheers,
Frank.

In a previous article, kamaro_kid@delphi.com () says:

>Sheesh.. Clay Walnum himself is the Manager of the ST database on Delphi..

Yes, I know.

>He's informed me that the Analog software is now publically
>distributable.. I'll see if I can have him post personally.

Thanks, I appreciate it. (Again, "publicly distributable" <> "in the public domain." Freeware and shareware programs are publicly distributable programs NOT in the public domain.)

>Guess my word isnt good around here, eh?

That's not really what I meant. If you posted that a release statement from Analog was available for public view on Delphi, or even that it was at one time, I would believe you, and this would end the controversy as far as I'm concerned. A release statement existing only in private e-mail does not in itself suffice.

Another problem will be, Clay posting a release statement _now_ would only be useful if he can speak for Analog now, which may or may not be the case. But that's something he could tell us also.

My best-case scenario: Clay Walnum posts somewhere reminding us how and when Analog made the statement releasing their programs into the PD. That such a public statement was made is all that we need to establish.

To briefly summarize this several-year-old topic as I've closely followed it, I consider it established that Compute did release their software into the PD because a number of different people corroborate seeing the release statement on the pay services.

It has not been established in this forum that Analog released their software into the PD, but with the help of James King and Clay Walnum this will hopefully get resolved this time around.

Finally, I've never seen anyone claim seeing a statement from Antic releasing their software into the PD, so I still don't believe it legally is.

|> Any clues?

Look for information about Adventure International's "COMMBAT", a two-player networked tank (?) war game. You may also be able to find "Dual Duel", an early clone of (what's the name of that vector graphics tank game?), where you use a custom joystick-to-joystick cable. DD is available on GEnie, and probably other services.

5564. neding help!

Newsgroup: comp.sys.atari.8bit
Date: 1994-10-03 22:49:27 UTC
From: chaos@oo.com
Message-ID: <19941003.1AAEB58.111CC@oo.com>
Source record: 98144

greetings folks, im a new user to the atari 8bit world. I am mainly looking for a few folks to trade some mail with for whenever i have a question
about this maching. <G> the system i have is the ATARI XE game system..its the
cool looking one with the detachable keyboard, a 1050 disk adrive, and the SX212 1200 baud modem. For a monitor i am useing a 9 inch apple composite, so the whole system is nice and neat and takes up very little space.

Anyways, i have done my homework, and read the FAQ and all that good stuff, so i have more or less figured out how to use this machine. However a few things still elude me, and i have questions about. PLEASE E-MAIL ME if you
know the answers, as i do not have normall access to the base..

first of all, what is a DCM file?? it is not in any of the FAQs, i tried to binary load it like the other programs, but no go. what is this file,
and how do i start it up?? I notice mose of the games on FTP sites are in dcm format...

q question about MYDOS...people have told me that is the best OS for the atari..however, if i do not own a hard disk, is it really any good? i just
use dos 2.5, normally. <also i havent figured out how to make mydos bootable..i have been loading it off of dos 2.5> are there any other shareware
operateing systems out there i should take a look at?

Also, is there an easy way to read text files from dos? or do i always
have to load up a program to look at a text files? its a bit annoying..esp. when i just want to look at a DOC.

Welp, anyways, im also looking for people to suggest good gamnes and programs for the XE..i hate the fact that most ftp sites dont have good descriptions of the programs, and i down load one junk program after another, scrapeing out and finding the goodies. if ya have any really cool ones, UUENCODE it and send it my way, will ya? id kiss your cyberfeet for it.

one last question. the audio output of my xe game system really sucks..i have to pump it through a large amp to hear it decently..is that the normal way these things were built, or do i just have a bad system?

welp, onc e again, looking for some folks to show me the ways
of the atari world, laters.

e-mail CHAOS@OO.com

Hi
DCM files are compressed with the Diskcomm Program. It should be available in the utility section of the board you've been calling. The files will uncompress to an entire disk. It's a great utility for modem transmission.

Personally. I don't like MYDOS. I've found Spartados to be much more versatile. If you're not afraid of working fron the DOS prompt. Then Spartados is the way to go.

I've found that the easiest way to view a text file is to copy it to the screen. If you are using atari dos select "copy" D1:FILENAME.EXT E: The "E:" is recognized as the editor or screen. The info is domped directly to the screen. The file will scroll continously untill you press (control 1) ^1 control 1 is the equivelant of pause on a PC.

Good Luck Tlee

Hey Folks!

I was going through my basement and found a VERY large box filled with my old Analog and Antic Magazines. They are in good condition and are just taking up space in my basement. If anyone is interested, I am willing to sell them at say, what $2 each? In bulk we can work on it.

I also have a printer interface for the 8-bit MPP1150, Still works.

Interested? Drop me a line...

Mark Santora

>hook the 65XE up to my Atari ST to transfer files across via a null
>modem cable?
Yup! The 65XE doesn't have an RS-232 output, and 850 or P:R: will do the job.

>3 - I've seen lots of 8bit software on ftp sites, and presuming I
>retrieved this using my ST and ported it over, would I be able to
>dearchive and use any of this with cassette, or do I really need a disk
>drive (I'm told the drives are very rare here in the UK)?
It may be possible with a cassette but it would be clumsy and slow, the best
option is a disk drive. True, disk drives are very hard to find over here, but
good places to look (for the drive and RS-232 interface) are:
Derek Fern - Micro Discount (can be expensive)
In New Atari User's Contact column (if they manage to get issue 68 out, last I
heard it was due on the 25th September - anyone know what the latest news is?)
in the pages of Micro Mart (some real bargains to be had sometimes)
or at the forthcoming All Micro Show in November in Stafford (at least I assume
it is still on)

: SpartaDOS awhile ago and I like it, are you still working on that catalog?)

Technically the MIO only supports 8, but it does have the ability to reload partition lists from various sources so you can have a larger drive in there. I don't see how tough this would be to implement on the MIO II. If the MIO II stores partition information in NVRAM then that's one thing, but if it writes and reads it from disk then as long as you can have it look to a different sector or a floppy you should be able to have larger drives.

The Black Box has a sectpr setting for where to look for the partition list. By reserving free space at the start of the disk, you can fool with this to do partition list swapping.

Last time I spoke with Tom Hunt he told me that it is definitely feasible to just BREAK THE DAMN 16 MEG BARRIER but perhaps at the cost of backwards compatibility. That is something to consider, an alternate FMS. I know with the AMIGA you can have a few flavors of FMSs available. Sparta already does this in its AtariDOS support. You might be able to implement a traditional vs. extended note/point Sparta FMS for larger partitions.

I just thought I'd bump in and say that if anyone is looking for a standalone printer interface, the MPP1150 is the one to get. The ICD printer interface doesn't allow daisy chaining out like the MPP and I think other ones also don't daisy chain. The MPP1150 also has a small buffer (less than 8K or so) but it is there. I used it a lot before I got my Black Box.

It is a piece of CSS maybe-ware ;)

No, really. It is the same as a P:R: only supporting high speed modems
and perhaps with a few other niceties. An onboard term loaded from an
EPROM inside is a possibility. The P:R: only supports up to 9600 and
that just doesn't cut it these days.

5583. The 16MB partition limit

Newsgroup: comp.sys.atari.8bit
Date: 1994-10-05 02:03:21 UTC
From: jduers01@solix.fiu.edu
Message-ID: <36t1h9$9pa@newshost.fiu.edu>
Source record: 98060

It is possible to break the 16 MB partition limit by kludging on an additional SIO command. This command would break the disk into 65535 sector segments. You could allow up to 256 sections this way. Of course, DOS would have to be rewritten to support it, but it shouldn't be a colossal undertaking.

Speaking of SIO commands, does anyone have any info on the commands used by Happy drives? I want to emulate a Happy with the SIO2PC, but I don't have info on the additional commands used. So far, I know about A,B,H,p, and w.

Any info would be greatly appreciated.

Jason

P.S. I would like to integrate Netmail into a PC BBS. Any info on these procotols would be greatly appreciated too. :)

For what it's worth, in early ANALOG's at least, the type-in games were always referred to as public domain. There were statements such as "Continuing ANALOG's tradition of great public domain assembly language games..." Check the articles accompanying Livewire, Retrofire, Planetary Defense, Bacterion, and Fire Bug.

Apparentely, I stand corrected. The following is a statement from the
last editor of Analog magazine, Clay Walnum:

From: BOS::ANALOG4 "CLAYTON WALNUM, ATARI ADVANTAGE MANAGER" 4-OCT-1994
13:41:26.99
To: BOS::KAMARO_KID
CC:
Subj: RE: Analog stuff

As far as I know, ANALOG programs are still owned by LFP, Inc. In any case,
even if the programs are no longer LFP's property, the copyright would
revert to the programs' authors. So, technically, unless at least the
program's author has stated that the program is public domain, the program
must be concidered to be copyrighted.

Raph,

You don't want to be doing that :-)

I had a helluva job finding an 850 interface! If you get hold of issue 3 of the Phoenix disk newsletter (out soon) then you'll find instructions for an RS-232 interface to build. The author, Jason Keane, has one connected between his Atari and an Amiga and he provides details of any modifications needed to get it hooked up to a PC.

Hmmm ... There are one or two component differences between this and the SIO2PC cable. I wonder if it's possible to use this interface instead of the SIO2PC cable? No point in building both if just one will do the job is there?

Good grief!! A whole year gone by and Menu Print still isn't finished.

Actually, it is now nearing completion since it has to be ready by AMS 8 next month. It had been hoped to include SpartaDOS, DOS 3 and DOS XE support but there just isn't enough time. If the first release version does well enough, then I'll produce an upgrade to include these and other menu/DOS systems next year.

So, the final specs are as follows:

1. Menus and DOS systems supported include - Rob C, Multiboot, Howfen Menu 3.0, K&D Menu, Atari Disk Utilities, DOS 1, DOS 2, DOS 2.5, DOS XL, MachDOS, SuperDOS 5.0, MyDOS 4.50, Transdisk IV XL and Transdisk IV XT.

2. Support for BOOT disks is also included. The package will come complete with a FREE ID Library disk which will contain recognition data for a large number of commercial BOOT disks. Other ID Library disks will follow.

3. Supports Atari Printers - not something you see every day!! :)

4. Easy to use with a pop-up menu display. The Database itself is particularly impressive (well, I think so anyway).

5. All Database entries are made by tagging from a list, but there is a provision for fully manual entries if you have disks not supported by the system.

Price is yet to be set as it will more than likely be released through Micro Discount in the UK.

If you have any queries or would like to express an interest in purchasing a copy then you can contact me via the e-mail.

> last month?

No. It was delayed, to be published on September 25th (I think...
Unless it was October, but I'm fairly sure it was September), so it
should be getting places by now. Page 6 were certainly still there a
couple of weeks ago, when I bought some software (and the 800XL field
service manual :) from them.

```
SHAREWARE AUTHORS WANTED FOR PILOT SCHEME!!
-------------------------------------------------------------------------------

The Atari Classic Programmer's Club has launched a new scheme aimed at trying
to increase registrations for non-UK resident Shareware authors. The scheme
involves authors registering their software with us and we will then handle
all UK user registrations on the author's behalf.

Part of this service is to supply any full versions of Shareware programs to
registered users within the UK. All the author has to do is keep us supplied
with any new versions of their software as soon as they become available.

The benefits to the author is that they do not have to spend a lot of time
with duplicating disks, getting manuals done and sending software off to
their registered users ... we will do all that.

The benefits to the UK user is that they do not have to worry about sending
money overseas or whether the author still lives at the address given in a
piece of software 5 or more years old!

If you would like to know more, have any questions, or would like to
discuss a possible arrangement with any software you have written, then you
can send a message to the e-mail address below.

-------------------------------------------------------------------------------
COMMERCIAL SOFTWARE ALSO WANTED!!
-------------------------------------------------------------------------------
We are continuously on the lookout for both new and existing software for
release/import into the UK. If you are interested in negotiating a marketing
agreement for your software then please get in touch by e-mail.

OK, no BS. Reproduced in it's entirety from the Jan 87 issue
#50 ANALOG. Page #2.
****
PERMISSIONS

No portion of this magazine may be reproduced in any
form, without the written permission from the publisher. Many
programs are copyrighted and not public domain.
Due, however, to many requests from Atari club libraries
and bulletin board systems, our new policy allows club
libraries or individually-run BBSs to make certain programs
from ANALOG Computing available during the month printed on
that issue's cover. For example, software from the July issue
can be made available July 1.
This does not apply to programs which specifically state
that they are not public domain and, thus, are not for public
distribution.
In addition, any programs used must state that they are
taken form ANALOG Computing magazine. For further
information, contact ANALOG Computing at (617)892-3488.

****

For the record, there were no programs in that issue that
stated they were not for public distribution.
IMO: Seems like even ANALOG is a little vague about what a
copyright is. Everything, including this message, is
considered copyrighted unless stated otherwise. It's not the
absense of a copyright notice that makes something PD, it's
the expressed statement that it is PD. I would be more
comfortable if it said "any time after" vs "during" but
allowing the programs to be in user group libraries seems
pretty straight forward. Since it serves my self interests,
I'm inclined to read this as you can make the programs
available any time as long as it is at least the 1st day of
the month or later since they do not indicate the programs
must be removed from the systems after a certain period.
Rick

I'd consider the magazine article to be "the docs".

>He adds that, "the magazine might have included some instructions on how
>to use it, but those would be the only docs I'm aware of." I guess that
>would be "docs" in a sense, right? But there's probably a lot more to
>the program than could be covered in detail in a single magazine article....

This isn't a huge program we're talking about. I doubt that they left
anything useful out. If you have the magazine (or its disk), you can
check the source for more, though. They probably commented the source
pretty well.

I just got hold of a Canadian 410 program recorder...
(the squarish one, not the chelco rounded one)
it has an update sheet saying it is now a 410P program recorder
since it now uses an extern 6vdc 300ma power pack.

Is this mentioned on the power pack list for devices?

Also, there is a "410 INSERT: Operating System 255"

It warns about using the 410 on a system that returns 255 to
peek(65528). It then goes on and explains about lining up the
splice in the tape (leader/media) so as to have the tape positioned
over the heads at the start of a read. I guess this stems from
the timing errors and such in the 800os. I just never saw it
documented by Atari before. The 800's with a 410 are so flakey.

5608. The Atari 8-Bit Home Page

Newsgroup: comp.sys.atari.8bit
Date: 1994-10-06 15:07:38 UTC
From: ipoorten@cs.vu.nl
Message-ID: <Cx9BCq.GHs@cs.vu.nl>
Source record: 98088

Since the end of May I'm maintaining a collection of WWW pages totally devoted to our beloved Atari 8-Bit Home Computers. It started out as a small page containing only a few links to FTP sites. Since then, I have been collecting documents to include and did indeed find some interresting stuff. Back in 'the early days' there were 'only' 70 visits a month (which did amaze me already), but last month it did increase to 177 times from outside the cs.vu.nl domain only!

The last few days I have been bussy doing a hypertext version of the Atari System Reference Manual which is now publicly available. It's now possible to have an online sort of 'Mapping the Atari'. Here, I would like to thank Bill Kendrick who provided me the plain ASCII version of it.

I want to ask everybody to send me all sorts of info (in digital form) you have about the Atari Home Computers. Really, everything is welcome. And, if it's worth the time, I will make an HTML version of it myself. But in any case I will make it available on the Web and through FTP.

Also, I would like to know how many _different_ people are actually accessing my page. So, if you have ever visited my Atari Home Page, please send a small message to: ipoorten=www@cs.vu.nl

Below I will present a small list of what currently have to offer.

The Atari 8-Bit Home Page

Documents...(ASCII)
* FAQ list
* Vendors & Developers List
* About the 65c816
* Documentation about the 6502/6510/8500/8502 instruction set
* Schematic of a small MIDI interface for the C64
* Atari System Reference Manual
* X-Modem/Y-Modem Protocol Reference
Documents...(PS)
* Opcode table for the 6502 and 65C02
Documents...(HTML)
* Atari System Reference Manual
* FAQ List
* Vendors and Developers List

FTP Sites...
* Atari Archive
* all its mirrors
and... * The PVV Atari 8-bit Archive

* Boston University Department of Computer Science

Magazine Disks...
* Antic Magazine
* Analog Magazine

Software...
* MODPlay v1.22 Distribution
* UnZip v1.13 Distribution

There's also a page containing this page's history and a page with polling statistics.

Please send comments, suggestion or additions to:

ipoorten=www@cs.vu.nl

Thanks for your attention.

: be able to implement a traditional vs. extended note/point Sparta FMS for
: larger partitions.

It would be nice to see that feature in SpartaDOS, the entire problem, as far as I can see, is backwards compatibility. I am familiar with disk structures on other platforms, but haven't looked into Atari or the SpartaDOS formats. Commodore used a similiar technique that Atari did, but they went track/sector, and the drive converted the track/sector numbers to a logical sector or maybe it was easier than that, who knows -- haven't examined the ROM on one of those drives to look at the DOS. I think the one that MS-DOS uses is a pretty good one. I would sacrifice backwards compatibility for that.

The following is my latest list of FidoNet nodes that carry the Atari 8-bit
echo. Thought you'd be interested. If you find any discrepancies, please
send me e-mail.

5614. Atari 8-bit material wanted!

Newsgroup: comp.sys.atari.8bit
Date: 1994-10-06 20:58:56 UTC
From: JBIBBER@fnal.fbalv.gov
Message-ID: <JBIBBER.8.2E94AD36@fnal.fbalv.gov>
Source record: 98099

A friend of mine is interested in purchasing any Atari 8-bit material. He does not have Internet access, please call Dennis Brimhall at (209)251-6907, or leave me email at jbibber@gcomm.com. Also, he would be interested in any Tandy material.

Thank you,
John

>
RK> Any clues?

Sure thing... there was a game that was a two-player tank duel that
was written for the APPLE-][, the TRS-80, and the ATARI, to be played over
a modem connection. The name of the game escapes me at present. David
Small, the ATARI guru, used to play a multi-player space battle game over
an online network. M.I.T. had a multi-player startrek space hunt game
played on their Altos network. Harvard had a multi-player character
graphics startrek as well as a "SPACEWAR!" type game that was played on
multiple terminals. Berkley had a space hunting game called "SEARCH" where
spaceships would "search and destroy" each other over a network.
Middlebury College in Vermont had a multi-player dungeons and dragons game
(called something like "Fracas" or "Attack!") that was playable over a
campus network. I believe that Digital Equipment Corporation had a game
called "The Universe" that was multi-player on multiple terminals. Then
there is also the veritible, tried and true, "modem chess". There must
have been at least a hundred hand-written versions of two-player chess over
a modem that people have written but never used due to the expense. Oh
yes, I forgot that Boston University wrote a multi-player startrek game for
an IBM 370 "paging terminal". That was quite a feat! Just about every
campus that had multiple terminals had someone write a multi-terminal game
at one time or another. Space and tank battle games appear to have been
the most popular at the time.

Do these "video games" need to be commercial? ...bitmapped?
...realtime only? ...non-networked? ...or will anything do?

5618. Can I format disks?

Newsgroup: comp.sys.atari.8bit
Date: 1994-10-07 06:46:16 UTC
From: odaman@rocky.unoke.pfu.fujitsu.co.jp
Message-ID: <9410070635.AA02789@rocky.unoke.pfu.fujitsu.co.jp>
Source record: 98092

Hi, Atari Freaks!

I tried format disks using MyDOS by "I" then "A". Some disks were
formatted. But others weren't be.
These others are 2HD 5inch disk formatted by MS-DOS at once.
Can't I use such disks on Atari console? Or if you have any
advices, let me know.

And next. I usually use MyDOS4.53. It is very nice, easy to use.
But some old disks are based on AtariDOS. And when I use on
AtariDOS, I can't use MyDOS disks. Is there a way to do?
I got ABC BASIC compiler. It runs on only AtariDOS, I think. But I
want to compile program saved on MyDOS disk(sio2pc disk).

Thanks for your reading!!
Please reply me to "odaman@pfu.fujitsu.co.jp"
Or "KHB07735@niftyserve.or.jp". :-)

5619. Portfolio RS232

Newsgroup: comp.sys.atari.8bit
Date: 1994-10-07 10:33:47 UTC
From: brown@uk.co.gec-mrc
Message-ID: <5476@hercules>
Source record: 98100

Summary:
Keywords:

sorry about posting this here by there doesn't seem to be a group for it.

A friend of mine has asked me about the RS232 add on for the Atari portfolio apparently it is just configured to act as serial port for printing not for 2 way communication and for Comms. However he says that Atari were going to make a public domain s/w driver for the port for such a purpose and leave it in the portfolio support areas on Compuserve and Genie. I have no access to this so how can I get it, and how can I get it onto a memory cartridge if I can't download via the serial interface in the first place.

Thanks in advance

Paul Brown

5620. Menu Print - Bounced Mail

Newsgroup: comp.sys.atari.8bit
Date: 1994-10-07 12:58:48 UTC
From: mbitdc9306@newi.ac.uk
Message-ID: <9410071253.AA21292@dylan.newi.ac.uk>
Source record: 98095

I've just received the Atari Digest posting of c.s.a.8 but it appears to be incomplete. I noticed at least one message in the Subject index relating to Menu Print but that part of the text didn't get through to me.

If you are experiencing any problems in getting through, keep trying. My e-mail address is ...

MBITDC9306@newi.ac.uk

The problem might have been caused by my tinkering with the TELNET facility here last night. I won't be doing that today.

Are users going to have to monkey with the sector size or does it work
with off the shelf 512 byte -sector drives?

There have been several of us with MIOs and SCSI drives that the MIO
didn't like.

Also, what's the max size per partition?

Matt

>I recall that someone was scanning in images of all of the 8bit Ataris a >while back and that they were going to be posted. What happened to that? >Where can I get them?

They're not done yet. I have most of them done, and all I have to do now is upload them to Delphi as planned. However, I'm out of town at the moment, and all I have is a 2400 dialup (read: SLOW). One night when I have the time, I'll start the upload and go to bed, and post them the next day.

Hello,
to connect an ST or an PC to the XL you only have to build
up a simple interface.
The diagramm is in the doc file for SIO2PC.
But you can buy it also from ANG-Software (adress is in the vendors list)
ANG also sold a very very nice software for the ST.
It is 1000 times better compared with SIO2PC.
Write to ANG for a free list...
There was also a diagramm and software for the ST published
in a german computer magazine some years ago.
I used it some times (but I sold my ST) and was very lucky with it.
The software from ANG is much improved as this...

>program's author has stated that the program is public domain, the program
>must be concidered to be copyrighted.

Slight problem: if they are still owned by LFP, then the authors cannot
place them into the PD because the authors are not the owners, and only the
owner can release property into the public domain.

But that's a big help. We now know that LFP never made a general release
of ANALOG programs into the public domain. We now know that ANALOG
programs are EITHER still the property of LFP, OR the property of their
original authors. From Clay's statement I think we can gather that when
LFP bought the program rights, the contract specified that if LFP were to
relinquish ownership, they were required to do so to the original author.
LFP apparently could not have made a general release of ANALOG programs
into the PD even if they wanted to.

So now the next step is to determine whether ANALOG programs rights are
held by LFP or have reverted to the program authors. Anyone know how to
get ahold of LFP?

(M. Current says Larry Flynt probably owns the rights to ANALOG
programs/articles.)
I'm not about to argue with Larry Flynt. But when I purchased the
ANALOGs that had the 'Permissions' statement, that statement
constituted a contract as part of the reason I purchased the magazine.
I don't think that a new owner can remove the rights of distribution
that I obtained when I origanally bought the magazine. This is a
bunch of nitpicking, REALLY.

Russ.Gilbert@apk.wariat.org (Russ Gilbert) says Analog copyright dis-
cussion is "nitpicking".

I disagree. Many Atari 8bit software games and applications are at that
stage where they are very likely to simply disappear into history if not
captured and archived during the next 5 years. It would be a shame to see
so much effort just disappear into nowhere because of ambiguities in the
copyright laws. I believe as a general discussion it behooves the Atari
8bit community to obtain a better awareness of what might legally be done
to salvage this software. I don't advocate illegal action, but the Atari
8bit - and a couple other previously popular 8bits - are the first comp-
ters in history that face this question of technological extinction. True,
many business computers preceeded them, but not home/game computers. These
are the machines that introduced the concept of the home computer available
to the public at large - and changed history in the process.

Anyone who wants to get in touch with Larry Flynt need only pick up the latest Hustler. I've also seen Lee Pappas of Analog on CI$ recently; he might have a line.

Here's a thought: since, apparently, LFP has never released the rights (an assumption, but given that none of the Analog authors around have received notice of a reversion of rights a safe one) would LFP be willing to sell the rights? If the price were low enough someone could buy the rights and announce, publicly and clearly, that all the files are PD. If people sent in donations to cover this expense they could finance further purchases, from commercial sources.

%%%%%%%%

To whoever was asking about the max partition size on the MIO II: Unless someone has written an all new DOS, it should still be 16megs - that's 256bytes/sector x 2 byte pointer. If the "new" MyDos ever comes out, it's supposed to give more (64 megs? I think). But that's a software limit, not hardware. Heck, 9 partitions x 16megs = 144 megs, which seems like a lot to me.

The 1200XL runs on 9V AC, and needs a minimum power of about 18 VA.

That would certainly be one productive possibility. Another one would be
if someone obtained the rights to all that software and started selling it
commercially again. Either way, making existing software widely and
legally available is what it's all about.

5644. 800 ain't working

Newsgroup: comp.sys.atari.8bit
Date: 1994-10-10 00:31:43 UTC
From: pbhoeff@io.org
Message-ID: <37a21f$f66@ionews.io.org>
Source record: 97925

I bought an Atari 800 second/third/etc-hand the other day, and much to my dismay it does not work properly. I've got an Atari 400 from which I can scavenge parts, and as this 800 only cost me 10 bucks I'm quite willing to poke around inside it.

Basically, when I power it up I get a brilliant light show on the screen. All sorts of colors flashing. The keyboard clicker is spluttering away as well. I've tried removing the extra memory card, and I've tried a few different power supplies, but no help. If I don't have any cartridge in the beast I just get one solid color.

Any help? Email or post here... either is great!

Message-ID: <Jw11p7L.lmcclure@delphi.com>
Source record: 97923

In mail dated 10-8-94, U43610@uicvm.uic.edu (Ken) said:

"I just ran into a 1200XL that I would love to see go..
No power supply, though .. Can anyone tell me (that
owns an XL) what the power supply rrequirement is..?"

The 1200XL uses a power supply with 9 volt A.C. output. It is the
same power supply used by the Atari 810 and 1050 disk drives, and the
older 400 and 800 (not 800XL) computers.

I currently own or have owned all of the above mentioned devices, so I
can verify the above information is accurate.

The Atari XDM121 daisy wheel printer takes a Silver Reed CF130 ribbon.
An Atari XMM801 dot matrix printer takes a Mannesman/Tally MS80 ribbon.

Source record: 97929

James,

Thanks for the offer of SuperDOS 5.1. Yes, I can receive uucoded stuff but at the moment I can't transfer them over to 8-bit disks - I'm working on a ST to XL cable that will correct that.

Does SpartaDOS 5.1 have the same first 8 bytes on the boot sector as SuperDOS 5.0? If so, then Menu Print will read SuperDOS 5.1 disks but version 5.0 will appear in the Database. At the moment, memory and time are very tight hence the reasons why I haven't been able to include SpartaDOS, DOS XE or DOS 3 - however, there should be room to add more to the DOS recognition table.

I will be finishing off side 1 of the Menu Print disk in the next couple of days and sending it off so that it can be protected. Hmm ... have you copies of earlier versions of SuperDOS? Although I won't be able to put those in the recognition tables this time, if the original version of Menu Print does well then I'll produce upgrades at a later stage.

5655. FORSALE Atari STE

Newsgroup: comp.sys.atari.8bit
Date: 1994-10-10 18:00:36 UTC
From: gcc@kookaburra.krldwa.mccaw.com
Message-ID: <37bvg4$17j@ftp-p.mccaw.com>
Source record: 97934
Cross-posted to: comp.sys.atari.8bit,comp.sys.atari.st,misc.forsale.computers,mccaw.forsale,seattle.forsale,pnw.forsale

Sorry for the last post I screwed up with the subject.

I have a Atari STE for sale it comes with the following.

4 Mg's ram
1 high res Atari mono monitor
1 Atari color monitor
20 mgbyte supra hard drive
2400 baud modem
clock

several hundread disks of software including the following with Manuals

Falcon and the mission disk
Lemmen's
Grand Prix
The pawn
Lattice C compiler
Neo Desk
Flash

and alot more I can't remeber

All for 500 + shipping (negotiable) I would prefer to sell to some one in the seattle area.

Contact George Constantine at George.Constantine@mccaw.com

or call 206-828-2384 W 9-5 PST
206-771-5251 H after 6pm PST

|>
|> : --

Flakey!? I've never had any problems. All I had for the first year on my 800 was a 410 - and I loaded/saved basic code ok. After 5 months, I wrote a basic/assembly program to take binary files from disk (at school) and write them to a boot tape. That worked like a charm. Now I was able to play Star Raiders, Galaxian, etc. Although I never got that supposed trick with the stereo track to work; where you could recorde stereo audio (music) then save a data file, adn if you turned off the data sound, when loading it would play the music. Did anyone get this to work (and how), or was this just some myth?

Rather than go through that much trouble, you might consider offering specific instructions for using one of the general-purpose FTP-to-mail servers for accessing your resources by mail. (Several such gateways are described in the FAQ.)

I had nothing but problems with the 410 I bought in '82. I always
saved programs two or three times (on different tapes) to ensure that
I would have at least one copy that would load back in. And I always
kept the tape path clean and used high quality normal-bias tapes.

After a few months of this I finally got an 810. It may been slow,
single-sided and 88K, but compared to the 410 it seemed like magic.
The people buy PCs today with 500 meg hard drives will never know
the fun they missed out on. :-]

>Raiders, Galaxian, etc. Although I never got that supposed trick with the
>stereo track to work; where you could recorde stereo audio (music) then save a
>data file, adn if you turned off the data sound, when loading it would play the
>music. Did anyone get this to work (and how), or was this just some myth?

Atari did this on several commercial cassetes. You can do it yourself
but it requires at least two stero tape decks. If you record the data
track first, and then the audio track, the erase head in your audio
deck will wipe out the data track. Similarly, if you record the audio
track first, the erase head in the 410 will wipe out the audio while
recording the data track. :-(

So to make this work you have to record the data track first on a
separate tape. Using at least two tape decks, you then connect the
right channel "in" of destination deck to the right channel "out" of
source deck. Then connect the left "in" channel of the destination deck
to whatever you wanted to record as audio (another tape deck, LP, etc.)
Roll everything at once and viola! - the data track copied on the right
channel and your very own audio track on the left.

More work than it was worth, IMO. However some of the Atari commerical
releases made good use of this (the foreign-language and speed reading
programs come to mind). In 1982 it seemed kind of impressive though,
and even more so to casual observers who didn't understand the technology
behind it -- "Wow - the computer's talking!" :-)

I've seen it quoted in most sources that you shouldn't clean the heads unless they need it. My 1050 has given almost 8 years of sterling service, and it hasn't had the heads cleaned *once*. If you use grimy or el cheapo disks, you may need to though, but this is more a reason for not using poxy disks.

5669. Atari Hardware Project Newsgroups: comp.sys.atari.8bit

Newsgroup: comp.sys.atari.8bit
Date: 1994-10-11 11:03:47 UTC
From: bfurbee@crl.com
Message-ID: <37drej$lif@crl5.crl.com>
Source record: 97947

I am wanting to work on a small hardware project and would like some other opinions on the feasability before I actually begin laying out money for such an undertaking.
Basically I would like to have my 800XL installed in a mid-size tower case (ala PC), here are the features I would like to integrate into the new case:

800XL Motherboard with 256K RAMBO
Atari 1050 Disk Drive as D1:
Atari XF-551 Disk Drive as D2:
2 Serial / 1 Printer Port (ICD P:R: Connector, or others?)
MIO-II from FTe
40 Mb or LARGER IDE Hard Drive (using MIO II)

A few gray areas exist so far:
1. Is there a way to interface to a PC/AT Keyboard?
2. Is there an extender cable for the Cartridge Port so I can port a cartridge cut-out on the PC case?

I plan on using the drive cables in the PC power supply to feed a lot of the equipment (the motherboard, floppy drives, etc), but I will probably need to branch off of the P8/P9 connectors on the PC power to feed floppy controllers, etc. Mounting all this stuff is going to take some space, otherwise I would have opted for a mini-tower case :)

Any input on this project would be appreciated. Some items I would like to be able to add in the future but not required in the base system would be the SuperVideo and SuperAudio upgrades, the 720K 3.5" floppy drive add-on to the XF-551 and a myriad of other items. Any input would be appreciated! Respond here or send E-Mail to addresses below.

Thanks,
bfurbee@crl.com

I used to have problems with my tape deck too, when I got it back in '86-
it was a Phonemark. Part of the problem seemed to be the power supply which
was built in- my Dad drilled some holes in the case and fitted an on/off
switch for when it wasn't in use, this seemed to help. I don't know if the
early 410s had a built in supply or if they drew it from the computer like the
XC12. Which begs the question (I've asked this before, but....)
What's the relationship between the phonemark and the XC12 recorders.
The case is the same except for the colour and the Phonemark/Atari logos, and
they are both made in the same place, so it would seem they're the same design,
but they aren't 'cos like I said, the XC12 doesn't need a power supply.
Incidentally, all the programs I'd had were with loading commercial tapes-
my own were fine (and it wasn't the azimuth 'cos they work on the XC12
equally well).

Don't know about the foreign language courses, but Kingdom and Hangman both
had music and voice overs while they loaded. Unfortunately, it was *really*
crap, just some American sounding person telling you about the game in a
bad salesmanish manner, while some horrible muzak played.
Energy Czar and Lone Raider both had music, but no voice over.
IMHO the only game of these four worth getting is Kingdom (if you can).
Dead simple, but it's fun!

I have my 8bit installed in a DEC Rainbow 100 case..

For your keyboard, either extend out the mylar or to use a PC
keyboard, get the Transkey upgrade kit from Dataque (find their
info in the FAQ).

Otherwise, with a little work, you can get your 1050 and XF to fit inside
a big enough case - by removing the external housing units and
separating the pcboard from the disk drive mech.

Good luck fitting an 8bit into a standard tower though - as there may
not be enough room for the 1050 or XF551 drive pcboards -- that's
why I had to use an old DEC case.. There was plenty of extra room
inside for motherboards, expansion boards, etc..

I've got my MIO and Adaptec inside the case too - along with about 800
meg of HD space!

5673. Atari hardware for sale/trade

Newsgroup: comp.sys.atari.8bit
Date: 1994-10-11 13:05:38 UTC
From: kamaro_kid@delphi.com
Message-ID: <JQzVZpS.kamaro_kid@delphi.com>
Source record: 97951

I have the following hardware items for sale/trade:

3 x stock 800xl (2 with SuperVideo/Audio and socketed)
1 x stock 1050 disk drive
1 x stock Percomm disk drive w/printer port
1 x 850 modem/printer interface
1 x PR:C modem/printer interface (requires no external power supply)
1 x CX85 Keypad
2 x Seagate ST251 40meg half height hard drives
2 x Seagate ST225 20meg half height hard drives
1 x Adaptec 4000a MFM to SCSI converter adapter card
2 x XM301 300baud direct connect modems (in original packaging)
1 x 815 Acoustic coupler 300 baud modem (brand new, in box)
1 x Hayes 1200 baud SmartModem
1 x 1020 printer/plotter
1 x 1025 direct connect NLQ printer
1 x 320k 130xe with TURBOOS Super-ROM upgrade
1 x 3 Slave CSS Multiplexor complete w/60 foot of 34pin ribbon cable
1 x (Forgot brand name) 30meg full height hard drive
1 x XEGS complete, brand new in box (Lightgun, carts, manuals, etc..)
5000 Assorted double density disks (some blank, most with sware) .10 ea.
1 x Custom 1050 dust cover
1 x Custom 800xl dust cover
3 x Custom 2600 dust covers

Fear not, as this is only a small sampling of my 'EXTRA' 8bit hardware. I still have far more than this, and use 3 XL's on my MUX regularly.

Points of order: All items must be prepaid (NO COD) with check or money order. I will not ship items that cost less than around $20.00, as it's simply a waste of time running to the post office for a $5.00 order (unless purchasing floppies in quantities).

Highest bidder takes (if cash deal) - otherwise, interesting trades (of items not listed on that list, of course - are highly recommended.

Yesterday I received the latest issue of Page 6.

The result of the summer mail-shot was very disappointing, only 12% of subscribers actually bought something from the Accessory Shop.

Therefore the future of Page 6 is still looking very unstable.

5676. how transfer PC

Newsgroup: comp.sys.atari.8bit
Date: 1994-10-11 19:24:31 UTC
From: hcl5384@ritvax.isc.rit.edu
Message-ID: <1994Oct11.192431.15593@ultb.isc.rit.edu>
Source record: 97954

I wonder if files are transferred from Atari to PC? I have oldest games for
Atari 800XL. How to connect from Atari to PC? Any had an idea????
Thanks!

5677. 8-bit BBS's? Transfer to PC?

Newsgroup: comp.sys.atari.8bit
Date: 1994-10-11 21:50:28 UTC
From: goble@maxwell.ee.washington.edu
Message-ID: <37f1b4$j6f@news.u.washington.edu>
Source record: 97955

(My guess is that this has already been talked about but I just joined this newsgroup).

I just got the new 8-bit emulator, XF2, for the PC and am eager to get some 8-bit software onto my PC.

Are there any 8-bit BBS's still around (any in the 206 area code)? Any ftp sites? Any utility software that can help?

Thanx for any info...

-Brian

: Summary:
: Keywords:

: sorry about posting this here by there doesn't seem to be a group for it.

: A friend of mine has asked me about the RS232 add on for the Atari portfolio
: apparently it is just configured to act as serial port for printing not for
: 2 way communication and for Comms. However he says that Atari were going
: to make a public domain s/w driver for the port for such a purpose and
: leave it in the portfolio support areas on Compuserve and Genie. I have no
: access to this so how can I get it, and how can I get it onto a memory
: cartridge if I can't download via the serial interface in the first place.

: Thanks in advance

: Paul Brown

I had the same problem, I ended up subscribing to Genie in order to
obtain the xmodem protocol transfer program. Although the built-in
menu-driven software only allows for printing to the serial port, DOS
allows for transmission of ASCII data with I think the following commands:
COPY AUX A:file (to receive a file onto the Portfolio) and COPY
A:file AUX for the reverse.
The long file that is needed is a hexadecimal file, so it
can be sent with the previous command. The 255-byte file converts the
other file to the executable file(the short file can also be transferred
with the DOS command). So, as long as you can get the DOS commands to
work, it is not necessary to have the program placed on a memory card.
But that is an option for only $5.00 according to an advertisement placed
in ST-Informer a couple months ago(I can pass on that information if you
would like). E-mail me if you would like to see about getting the
files. I also have a text file that describes how to construct a cable
for using the Atari 8-bit to communicate with the Portfolio.

If the soundpath between the tape drive and the speaker were clean, using the tape as a multimedia audio device would still be something neat to play around with. However, even with correct track separation, there is a LOT of noise introduced into the signal on its way to the speaker. I don't know if it is due to horrendous crosstalk on the heads or RF interference on its path to the speaker or both but it makes it impossible to get as good audio as you'd get playing the tape through a regular deck.

I tried doing this with a 4-track recorder which can record on any individual track perfectly, so I know I got it right. It was the drive and the electronics that introduced the noise.

Dag Hugdahl (Dag.Hugdahl@flight.org) wrote:

: Have you heard of a possible date of release?

Several times. That is the problem. THere was a release notice on it
many months ago now, like last spring. That said SOON on it. CSS usually
doesn't claim a release time and then reneg on it. It is uncharacteristic
of them and a bad sign for the future of the company that they were at
once so sure of a release schedule and then it being pushed back to what
will probably be Xmas at the earliest if not spring.

YebHavinga wrote:
: Ok, so no fully equiped Unix on the atari 8-bit,
: but what about a client to Linux ?

You mean like SLIPP? That would require a bidirectional modem handler. The Atari's clock speed prevents reliable asynchronous RS232 data communications beyond about 19.2K BPS. Bidirectional hacks would take even more power. SLIPP accounts are slow at 57K connections, let alone 19.2K. SLIPP is essentially a way to run your own Internet site, and every time you access something locally, it gets what it needs from the provider (or so I have heard). Therefore it is transferring massive amounts of data. The rather slow (compared to PCs) hard drive data rate is also a problem. Lastly, the system requires a Unix OS overlay or at least some way to fool the provider and I think the possibility of doing this within the 8-bits memory limitation, even with a truly herculean banked ram system, would be impossible. Even with a 65816 it would probably be impossible to do this where it would actually be practical.

5690. Re: 8-bit BBS's? Transfer to PC?

Newsgroup: comp.sys.atari.8bit
Date: 1994-10-12 00:22:08 UTC
From: krishna@max.tiac.net
Message-ID: <37fa7g$s7t@sundog.tiac.net>
Source record: 97979

The best way to transfer to other machines is via the Floppy Board or XF upgrade and the BBXFER.COM program. This lets you read and write to MS-DOS disks. It only lets you transfer back and forth within that program, not a handler to install an MS-DOS filesystem for general usage, but it is still a lot better than null modems, which aren't always possible. If you can read and write MS-DOS 720K 3.5" disks, you can pretty much communicate with ANY platform, not only IBMs. For instance:

Unix Workstations -> mtools utility allows writing MS-DOS floppies
MAC -> There are MAC utilites to read/write 720K MS-DOS floppies
Amiga -> CrossDOS autosenses MS-DOS disks and allows read and write
ST -> the Atari ST disk structure is identical to MS-DOS

I have had personal experience transferring files between all of the platforms mentioned except the ST. I brought Atari Archive files to my Atari via mtools on a workstation, and I helped finish the titles on my student film by writing an MS-DOS disk with the ASCII titles for use by a guy with a MAC and a DTP package to read it off of. And most recently I have been transferring files to and from my Amiga 1200.

Finally, you can always ask Michael for a copy at
mailto::mcurrent@carleton.edu

Objective of this file:
Much discussion has gone on in the comp.sys.atari.8bit Usenet
newsgroup about the newly released (mid 1994) Atari 8bit emulator for
IBM / MSDOS based computers, the PC X-Former 2.0 (XF2 for short). Many
people in the 8-bit community have gotten, well, fed up with the XF2-based
questions which do not pertain to them, or to the really dumb questions
which are in fact understandable to new or rusty Atari 8-bit users, but
have just gotten on the nerves of some of the comp.sys.atari.8bit
readers/digest subscribers.
This file was created to reduce the number of 'newbie' and XF2
questions.
```

This FAQ will present answers to simple questions like "how do I turn
off BASIC" (a good answer to that of course is, READ THE FRIGGIN' MANUAL)
and "how do I get a disk directory?" (which is less obvious on
Atari 8-bits, err.. MOST 8-bits <grin>).
It will also direct people who are unaware of the large amount of Atari
8-bit support (NOT NECESSARILY EMULATOR SUPPORT) and perhaps become a
suplement for the many official and unofficial files floating around the
net (like the official FAQ, the Vendor/Developer List, the Who's Who list,
etc.).

---=== XF2 Questions: ===---

Q.1) What does "READY" mean?
A.1) This is the Atari BASIC prompt. See below for hints on Atari BASIC.

Q.2) Why doesn't this program load?
A.2.1) The program may not work under the Atari 800 Operating System, it may
require the XL/XE Operating System (which XF2 does not emulate).
A.2.2) Be sure you turned BASIC off before trying to load it if it cannot
run with BASIC on.
A.2.3) It may just refuse to run on the XF2 emulator.

Q.3) How do I turn off BASIC?
A.3) To toggle BASIC on and off, press [SHIFT]-[F10] ([F10] is [RESET], note:
on a real Atari 8-bit, [SHIFT]-[RESET] does not have this effect).

Q.4) Why doesn't this game/program run correctly?
A.4.1) It may use player/missle collision detection which is not supported
on the XF2.
A.4.2) (See Question 2).

Q.5) How do I exit XF2 and return to DOS?
A.5) Press [F5]. Note: this does NOT temporarily 'shell' or 'jump' to MSDOS.

Q.6) How do I get to Atari DOS?
A.6.1) In BASIC, type "DOS" at the "READY" prompt.
A.6.2) Reboot without BASIC on.
A.6.3) Be sure you have a DOS-bootable disk image as the first MSDOS
parameter after the "XF2" command. (DOS25.XFD and MYDOS45.ATR are
both DOS boot-disk-images and are both in the XF2.ZIP file).

Q.7) How do I use MSDOS files with XF2?
A.7.1) Add the files to the command line and use them as their respective
drives (be sure the first drive is a DOS-bootable disk image).
Example: XF2 MYDOS45.ATR filename.ext
When booted the Atari will have two drives, D1: will be the MyDOS
4.50 disk image and D2: will be a write-protected disk which contains
only the file "filename.ext". Note: there are bugs in XF2 which
make accessing files from different directories a bit hard, just use
the MOVE (or COPY and DEL) commands in MSDOS to get the file to the
directory where you call XF2 from.
A.7.2) Use the MSDOS program S2PC (S2PC.ARC available in the Utilities
directory at the UMICH archives) which allows you to access files

within a MyDOS/compatible .ATR disk image without using an SIO2PC
or the XF2. S2PC let's you read, write, delete, change directory,
and view the directory of a MyDOS/compatible .ATR disk image. It
can be used via command-line parameters from MSDOS, or as a menu.

Q.8) Just what ARE .ATR and .XFD files?
A.8.1) Refer to the XF2 and SIO2PC manuals for details on these files.
A.8.2) Simply put, they are Atari disks, stored as files which are as big
as the disk they represent (an 88k disk image will use 88k on the
IBM). .ATR files are used by SIO2PC (see below) as well as the XF2
(and the S2PC program mentioned above). .XFD files are used by
ST X-Former (the Atari 8-bit emulator for Atari ST's) and
PC X-Former (XF2).

Q.9) What's SIO2PC?
A.9.1) Refer to the XF2 and SIO2PC manuals for details on this program.
A.9.2) This is a program which runs on IBM/compatibles which, with the use
of a simple (and relatively inexpensive) cable, makes the IBM act
as though it were an Atari disk drive. (Up to four drives, actually).
It uses disk image files (.ATR's) and can also let the Atari access
single IBM files (much like XF2 does) as a single file all alone in
its own disk. It also currently allows Print-Thru (all access to the
Atari "P:" (printer) device can be redirected to the IBM's printer,
screen, or MSDOS file; different translations/conversions are
user-defined when the Print-Thru mode is turned on). Finally, with
the use of two programs on the Atari 8-bit (the only two programs
that currently have anything to do with SIO2PC that have been written
(to my knowledge) for the Atari 8-bit), the IBM can be controlled
remotely (commands are sent from the Atari, typing on the IBM is not
necessary) and files can be sent directly to the IBM's drives.

Note: The following sections will simply discuss Atari BASIC, the Atari OS,
and Atari DOS 2.5 and MyDOS 4.50 (because these topics seem the most
relevant to the less-knowledged/experienced XF2 users).

---=== Getting around on the Atari: DOS and OS ===---
I. AtariDOS and MyDOS QuickReference:

MyDOS presents the user with the following commands:

[*] Disk directory of current directory (like "dir *.*" in MSDOS)
[1]-[9] Disk directory of a disk drive (like "dir a:*.*" - "dir i:*.*")
[A] Disk directory (like "dir <mask>" and optional output destination)
[B] Quit to cartridge
[C] Copy file(s) ("<source>,<destination>" copies from one place or
disk to another, just "<source>" copies from one place on one disk
in a drive to the same place on another disk in the same drive
(asks for swapping))
[D] Delete file(s) (add "/N" to delete without being prompted first)
(add ">*.*" or ":*.*" after a subdirectory name to delete the
files within it. A subdirectory name alone will delete the
subdirectory (if it is empty and unlocked)). (Acts like both

"del" and "rd" in MSDOS.)
[E] Rename file(s) (renaming multiple files is allowed, but be careful).
(like "ren <old> <new>" in MSDOS - with MyDOS, use "," between
old and new masks.)
[F] Locks file(s) from overwrite, deletion and appending (like
"attrib +r <mask>" in MSDOS.)
[G] Unlocks file(s) (returns them to their default state).
[H] Writes DOS files to a disk (this creates a disk which boots with
the current version of MyDOS you are using and also has the menu
file "DUP.SYS" on it as well). (This is like "sys"(?) in MSDOS.)
[I] Formats a disk (add "/N" after the drive number to do a quick-format
of an already-formatted disk (ie, just a very fast delete "*.*").
[J] Duplicate disk (copies an entire disk, including boot sector,
when using XF2, it's much quicker to just copy one .XFD or .ATR to
another).
[K]
[L] Load binary file: loads a compiled program. (like "<filename>" in
MSDOS, except any ".EXE", ".COM", ".OBJ", etc. is still required.)
[M] Run at address. Mainly for advanced users. Reboot is "E477",
reset is "E474" (these are the hex values of the addresses where
the routines to reboot and reset are.)
[N] MEM.SAV: when this is on, whenever you go to DOS (from BASIC,
for example) it will write what is in memory to a file "MEM.SAV"
so that when DUP.SYS (the menu) loads it isn't lost forever.
When you exit DUP.SYS with the "B: Run Cartridge" command, MEM.SAV
is reloaded and the environment should be as it was when you left.
It's probably quicker to simply "SAVE" your programs (if in a
language) which aren't nearly as big as all of the memory that
MEM.SAV saves.
[O] Options: this presents the user with some options. Mainly for
advanced users or special setups. See the MyDOS docs for details.
[P] Set density. Forces a drive to be recognized at a certain density
if MyDOS can't figure it out. (??)
[Q] Make a subdirectory. (like "md" or "mkdir" in MSDOS).
[R] Set default directory. (like "cd" in MSDOS and "cwd" in SpartaDOS)
This makes "D:" now the same as a subdirectory or other drive.
ie, "D2:" will make all calls to "D:" act as though they are to
"D2:" instead. Some programs when prompting for filenames do not
add "D:" to the beginning if one is not present, they add "D1:".
If you don't trust a program to look to "D:" instead of "D1:" and
you want it to look to some place OTHER than "D1:" (ie, where "D:"
is pointing which could be a VERY long path list), just add "D:"
to the beginning. ALSO, some programs don't even ADD "D:"'s if they
aren't in the filenames you give and may give errors (138, for
example: device not present, ie, if you said "TESTFILE.DAT" it
may think you want "T:" instead of "D:TESTFILE.DAT").
[S] Set ramdisk number. This is also under [O]ptions.
[V] Verify writes. This is also under [O]ptions. When Verify is on,
writes will be slower but 100% reliable. With it off, writes will
be much faster but possibly not as reliable (on bad disks, for

example). Default is off.

AtariDOS presents the user with the following commands which are identical
to MyDOS's commands: A,B,C(no swaping),D,E,F,G,H,I(some densities),J,K,L,M,N

AtariDOS 2.5 presents the user with the following commands not present or
not the same as MyDOS's commands:
[O] Duplicate file. This is used to copy a file from one disk to another
using only one drive. (In MyDOS, giving just a source will make
[C]opy act like DOS 2's Duplicate.)
[P] Format Single. In DOS 2.5, this is used to format 88k (Single Density)
disks. To format an Enhanced Density (127k) disk, just use [I].
In DOS 2.0, [I] is the only format option and only handles 88k.
(I may be wrong, but I have never had a Double Density drive under
Atari DOS 2.0 or 2.5!)

II. General DOS and OS questions:

Q.1) How do I access the disk drives?
A.1) First, you need to have booted with a DOS. All but one DOS is on
disk (SpartaDOS X is on cartridge). When the Atari boots up, it
does some of its 'boot-up stuff' which includes looking for a
disk drive connected and turned on which is set up as drive #1.
It then begins to load from the disk's "boot sector". If none
exists or there's a nasty error on the disk, you get the
"BOOT ERROR" notice until the error is fixed. (On SpartaDOS disks,
even non-bootable disks have a boot sector, but all the boot
sector is is a small program which displays a 'not a boot disk'
error).
To end the digression, the answer to 'how do I access the disk
drives' starts with 'you must boot the Atari with a DOS'. Check
the 8-bit FAQ and the UMICH and other FTP archives for lists of
DOSes available for Ataris, but the most used are Atari DOS (for
compatibility with almost ALL older software), MyDOS (for an
Atari DOS compatible high-end DOS), and SpartaDOS (for a very
high-end DOS which looks much like MS-DOS but unfortunately
cannont run all software which runs fine with Atari DOS and
MyDOS.) Note: SpartaDOS does NOT run on Atari 400's and 800's
(except the cartridge versions and I believe disk version 1.1).
Now that you have a DOS loaded, the Atari understands the
"D:" device (see below for Atari devices). Since there is more
than one disk drive, you have to be able to tell them apart.
The Atari uses numbers when it has more than one of the same
device, so "D1:" is drive 1, "D2:" is drive 2, "D3:" is drive 3,
etc.!
After the "D:" device name comes the filename. Of the most used
DOSes, only MyDOS supports lowercase letters in filenames, but
since most programs force uppercase entry for filenames, nobody
really seems to use lowercase in their filenames.

Q.2) How do I copy things from one place to another?
A.2) Atari DOS and MyDOS give you the "C" command in their menu

interface. When it asks for a source and destination, you can
use wildcards (* and ? like in most other DOSes) to copy more
than one file at a time. You can also present no destination
so that a file can be copied from one disk in drive 1 to another
disk in drive 1, for example, and the DOS will ask you to insert
each disk.

Q.3) What are subdirectories?
A.3) Subdirectories are places where files go which are just like the
normal directory of a disk, except the they happen to be WITHIN
that normal directory, or even another subdirectory. For example,
you can have your disk divided up into the "GAMES" files, the
"GRAPHICS" files and the "SOUNDS" files. A directory of the disk
(the "root" or "base" or "trunk" directory) will simply list the
three subdirectories, "GAMES", "GRAPHICS" and "SOUNDS". Then,
if you ask for a directory listing of the "GAMES" subdirectory,
you will see the files (and perhaps other subdirectories) within
the "GAMES" directory. Think of it as a tree. For people familiar
with Macintoshes, "Folders" are simply subdirectories. A window
which appears when you open a "Disk" Icon is the "root", and all
of the "Folders" within it have more windows in them which also
have file and folder icons.
Here's a comparison to using subdirectories on different DOSes
root 'GAMES' 'SPACE' within 'GAMES'
AtariDOS D: n/a n/a
MyDOS D: D:GAMES: D:GAMES:SPACE:
SpartaDOS D: D:GAMES> D:GAMES>SPACE>
MSDOS (IBM) \ \GAMES\ \GAMES\SPACE\
Note, only Atari DOS would be using drive 1 here, all other DOSes
are not necessarily using drive 1, and MyDOS and SpartaDOS may
already 'be within' a subdirectory.
In MyDOS and SpartaDOS (and MSDOS), you can change the 'current'
or 'default' directory to a different place (a different drive or
a subdirectory). "D:" can stand for "D1:" (like AtariDOS always
does) or "D2:GAMES:SPACE:"! PLEASE READ THE MYDOS DOCUMENTS FOR
DETAILS ON THIS!

Q.4) What does "P:", "E:", "K:", etc. mean?
A.4) As stated before, the Atari has devices. "D:" is added when a
bootable disk in drive 1 is read. Other exist as well:
C: cassette - readable and writeable, no filenames
D: disk drive - readable, writeable, random access, directory,
files, multiple devices (up to 9 on MyDOS and newer SpartaDOS,
8 on AtariDOS)
E: editior - readable, writeable. This is how input from the
keyboard and output to the screen is normally handled. If
you wish to type a small file up by hand and have it sent to
the printer or a file, use "E:" as the source.
K: keyboard - readable. This is just the keyboard. Input from
it is not 'echoed' back like with the "E:ditor".
P: printer - writeable. Send data to this and it will appear

on the printer. You can print files (documents, etc.) by
using "P:" as the destination. The Atari XL/XE OSes support
"P1:" and "P2:", although I believe this usage is rare.
R: RS232 - readable, writeable, concurrent mode. This is not
built in to the Operating System, but is loaded. It supports
modems. The Atari 850 Interface has it's "R: handler"
'built-in', which means the Atari also looks for an 850 (or
other compatible interface) and receives the "R: handler" code
from it. Other interfaces and the Atari 'direct-connect'
modems require a file to be loaded which contains the "R:"
code. "R1:" and "R2:" is also supported, but also its usage
seems rare.
Z: RTime8 clock - readable, writeable. This is also not built
in to the OS, but loaded. This is loaded from disk and lets
the user access the "RTime8" real time, battery-backed up clock
for the Atari 8-bit. (This is a cartridge-based device).
I am unaware of any "Z:" clone which let's you set the Atari
internal (non-real time, non-battery-backed-up) clock if you
do not have an RTime8, although I'd love to see one! <hint!!>

Q.5) How do I print something from DOS?
A.6) As stated above, just use the "C"opy command, then use the file
you wish to print as the 'source', and "P:" as the 'destination'.
Example: "D1:DOCUMENT.TXT,P:"

---=== Getting around on the Atari: BASIC ===---

Q.1) What does "READY" mean?
A.1) Again, this is simply the prompt that Atari BASIC (and most older
BASIC's) presents the user when it is in "Immediate" mode.
Entering a command will cause it to act immediately.
Entering a line number and then a command will place that line into
the current program.
Entering a line number alone will remove that line from the current
program.
To start a program, use the "RUN" command.
To erase a program, use the "NEW" command.
To clear variables, strings and arrays, use the "CLR" command.
To load a program, use the "LOAD" command followed by a filename
(see below). To load and run a program, use the "RUN" command followed
by a filename.
To save a program, use the "SAVE" command followed by a filename.
To list a program, use the "LIST" command followed by an optional
start and end set of lines seperated by commas.

Q.2) Where can I learn Atari BASIC?
A.2) A (set of) file(s) will be created explaining all of Atari (and Turbo)
BASIC's commands and their usage. (A larger file may be produced
which will be based on examples provided in the Atari BASIC Reference
Manual). (As of today, 7/23/94, these particular files do not exist).

Q.3) How do I quit BASIC?
A.3.1) Type "DOS" to quit BASIC and return to DOS.
A.3.2) Type "BYE" to quit BASIC and exit to the OS's "bye" routines
(Atari Memo Pad on 400/800's, Atari Rainbow on 1200XL's, and
Self Test on other XL's and XE's). (Note: On 1200XL's, use [HELP]
to go to the Self Test when the Atari Rainbow appears).
A.3.3) For XF2 users, remember, [SHIFT]+[F10] reboots and toggles BASIC.

Q.4) Why don't strings work?
A.4) Strings must be "dimensioned" like arrays in Atari BASIC. Strings
are special character arrays. See the BASIC usage/etc. files mentioned
in the answer to question 2. Simply put, to make a string that will
accept up to "#" character, use DIM <name>$(#) . Example:
DIM A$(10) - now A$ can contain between 0 and 10 characters.

Q.5) How do I make graphics?
A.5) Use the "GRAPHICS" command to switch between the following screen modes:
(Note: All modes except 0, 9, 10 and 11 have four lines of 40 x 24 x 2
sized text covering the bottom of the screen. Add "16" to the mode
number to remove this window (but do not make any PRINTs or PUTs to
the standard output otherwise a GRAPHICS 0 screen will appear))
(Note: Add "32" to the mode number to keep the screen from clearing
when it appears. One problem, however, all screens overlay each other
so unless you only use certain modes at certain times, parts of some
screens will become (or start out) with 'garbage' on them.)
0 40 x 24 x 2 text
1 20 x 24 x 5 text
2 20 x 12 x 5 text
3 40 x 24 x 4 graphics
4 80 x 48 x 2 graphics
5 80 x 48 x 4 graphics
6 160 x 96 x 2 graphics
7 160 x 96 x 4 graphics
8 320 x 192 x 4 graphics
9 80 x 192 x 16 luminence-only graphics
10 80 x 192 x 9 graphics
11 80 x 192 x 16 hue-only graphics
12 40 x 24 x 4-colored text
13 40 x 12 x 4-colored text
14 160 x 192 x 2 graphics
15 160 x 192 x 4 graphics
Commands available in Atari BASIC for manipulating simple graphics
include:
PLOT x,y POSITION x,y COLOR c (c=color or character value)
DRAWTO x,y LOCATE x,y,r (where r is where result will be stored)
SETCOLOR c,h,l (c=palette location, h=hue, l=lum)
Colors:
COLOR command colors are not identical to SETCOLOR command colors:
COLOR 0 will draw using the background color, set with
SETCOLOR 4,hue,lum
COLOR 1 will draw using color "0", set with
SETCOLOR 0,hue,lum

COLOR 2 will draw using color "1", set with
SETCOLOR 1,hue,lum
COLOR 3 will draw using color "2", set with
SETCOLOR 2,hue,lum
Except in GRAPHICS mode 10, where COLORs 0, 1, 2, and 3 must be
POKEd into memory locations 704, 705, 706 and 707 (the
player/missle graphics color locations). Examples of this will
be presented in the BASIC usage files. (Sorry)

Q.6) How do I make sound on the Atari
A.6) Remember, XF2 doesn't support sound! But, anyways, in Atari BASIC:
SOUND c,p,d,v
c=channel (0-3)
p=pitch (0-255)
d=distortion (0,2,4,6,8,10,12 or 14)
v=volume (0-15)
The buzzer character is CHR$(253) aka [CONTROL]+[2] (NOT [CONTROL]+[G])

Q.7) How do I move the cursor and edit?
A.7) The Atari "E:" device (standard input/output which is the "editor")
allows the following characters for editing:

Key: AtASCII #: Use:
Atari none Turn inverse on/off (Atari 400/800 kybds)
Inverse [Triangle] none Turn inverse on/off (Atari XL/XE kybds)
CAPS none Turns caps-mode to lowercase (400/800 OS)
CAPS none Toggles caps-mode from upper to lower (XL/XE)
Sh-CAPS none Turns caps-mode to uppercase (all OSes)
Ct-CAPS none Turns caps-mode to [Control]-[Lock] (all)
Up ([^-]) 28 Move cursor up
Down ([^=]) 29 Move cursor down
Left ([^+]) 30 Move cursor left
Right ([^*]) 31 Move cursor right
Space 32 Move cursor right (overwrites w/Space char)
BackSpace 126 Move cursor left (deletes previous char)
Delete ([ShBkspc]) 156 Deletes a (logical) line (1-3 physical lines)
Insert ([Sh>]) 157 Inserts a physical line
Ct-Delete ([^Bksp]) 254 Deletes char under cursor, pulls rest left
Ct-Insert ([^>]) 255 Inserts space under cursor, pushes rest right
ClearScn ([^<]) 125 Clears screen
Bell ([^2]) 253 Sounds buzzer
TAB 127 Moves cursor to next TABstop
ClrTAB ([^TAB]) 158 Clears any TABstop under cursor
SetTAB ([ShTAB]) 159 Sets a TABstop under cursor
ESC 27 Sets ESCape (next edit char after is shown,
not done, non-edit chars shown (like normal))
RETURN 155 Sends End Of Line (moves cursor to lowerleft
of next line, accepts input)
Note: Inverse characters have values of the normal version of the
characters plus 128. (The only non-viewable inverse character is
inverse-ESC, or what would be the [ESC],[RETURN] combination. The

character exists, but must be set into screen RAM by hand. Oh well,
at least you still have 255 easily viewable characters! <grin>)

Q.8) How do I make the editor characters appear
A.8.1) As shown above, you must have an ESC sent before them.
When simply entering text, type [ESC] then the edit key and the
character for that edit key should appear.
When entering text in a PRINT statement, you must have it send an
ESC beforehand, so first type [ESC],[ESC] to make an ESCape character
appear, then type [ESC] then the edit key and the character for that
edit key should appear. When the PRINT statement is executed, the
first ESCape (which you typed as two [ESC]'s) will make the editor
SHOW the following character (even if it is an edit character), then
the character which you entered (with [ESC] and then the edit key)
will make that character appear. This makes it difficult to align
a set of PRINT statements which make a multi-line picture or menu
which uses viewed edit keys. It is probably best to have all of the
lines in your program with the PRINT statements that can fit visible
on the screen, then edit them (without putting any of the ESCape
characters in, then when the picture looks like how you want it on
the screen, move the cursor to on top of each edit-key character and
press [Control]+[>] (Control-Insert). A blank space should appear
under the cursor and the rest of the line should move right. Now,
type [ESC],[ESC] and an ESCape edit-key character should appear
where the blank space was. When you are finished doing that for
each line with those PRINTs in it, BE SURE TO ENTER THEM INTO THE
PROGRAM BY PRESSING [RETURN] ON EACH OF THOSE LINES! Whew!
A.8.2) Set the memory location "766" to "1" with the command "POKE 766,1"
to turn on the no-edit mode (ALL characters except End Of Lines
will appear, even ClearScreens!) When you want to go back into
normal mode, set the location back to "0" with "POKE 766,0".

Q.9) What's with the colors changing?
A.9) THIS, MY FRIEND, IS THE FIRST EVER SCREEN SAVER! This is called
"Attract mode" as was used on the Atari 2600 and Atari 400/800/XL/XE
series (and probably on the 5200 and 7800 but I cannot confirm this).
When a key hasn't been pressed for 7 or 9 (depending on OS, model, etc)
minutes, the screen colors begin changing, thus protecting your TV
or monitor from having a static image burned on it.
To turn this mode off, press a key, or, if within a program, use the
command "POKE 77,0" at least once every few minutes (IF the screen is
active, otherwise turning it off would be kinda useless).
To turn it on, wait 7 or 9 minutes without pressing a key or having
location "77" set to "0", or set location "77" to "128" with
"POKE 77,128", voila! instant attract mode!

Q.10) How do I access 'devices' on the Atari?
A.10) The following commands are available to Atari BASIC's (and also
variations on these are available in most other Atari languages!):
OPEN #a,b,c,d$ Opens channel 'a' for access to 'd$' in mode 'b'
with auxillary mode 'c'. Channel 'a' must be

free or a 'Channel already open' (129) error
occurs. Examples:
OPEN #1,4,0,"K:" - input from keyboard
OPEN #2,8,0,"P:" - output to printer
OPEN #3,12,0,"D:FILE" - random access to disk
OPEN #4,9,0,"D:DATA" - append-output to disk
OPEN #5,13,0,"R:" - concurrent to RS232 (modem)
OPEN #6,6,0,"D:*.TXT" - directory access to disk
(reads directory of "*.TXT" mask)
CLOSE #a Closes channel 'a' (freeing it for use)
GET #a,b Reads a byte from channel 'a' and stores it in 'b'
PUT #a,b Puts byte 'b' onto channel 'a'
INPUT #a,b$ Reads a string (up to 255 bytes and a REQUIRED
'end of line' (character 155)) from channel 'a'
and stores it in 'b$'
INPUT #a,b Reads a string (up to 255 bytes and a REQUIRED
'end of line' (character 155)) from channel 'a'
and stores the numeric value of it in 'b'
PRINT #a,<stuff> Just like the normal BASIC PRINT statement, but
sends the information to channel 'a' (semicolons,
comas, and mixed types are of course allowed).
STATUS #a,b Reads the error 'status' of channel 'a' and stores
it in 'b'
XIO a,#b,c,d,e$ General I/O call. This a little complicated and
may be expanded upon in a future revision. Just be aware of the
following:
a - command
b - channel to use (usually must be free)
c - auxillary mode 1
d - auxillary mode 2
e$ - file or device to act upon
Examples:
XIO 32,#1,0,0,"D:FILE,OLDFILE" - renames file
XIO 33,#1,0,0,"D:OLDFILE" - DELETES file
XIO 34,#1,0,0,"D:GAMES" - creates a directory in My- & Sparta-DOS
XIO 35,#1,0,0,"D:NEWFILE" - locks a file from over-write and
deletion
XIO 36,#1,0,0,"D:NEWFILE" - UNlocks a locked file
XIO 40,#1,4,0,"D:PROG.OBJ" - loads and runs a binary file
(like "L" in Atari and MyDOS)
XIO 40,#1,5,0,"D:PROG.OBJ" - loads a binary file
(like "L" in Atari and MyDOS with the "/N" option)
XIO 41,#1,0,0,"D:GAMES" - changes default directory that
drive/subdirectory (all calls to "D:" will now occur within
that drive/directory)
XIO 254,#1,0,0,"D2:" - FORMAT a disk (in Atari DOS 2.5, this is
format 'enhanced', to format 'single' density, use XIO 253)
(in MyDOS, this is format, but not 'enhanced', use
XIO 253,#<channel>,1,0,"D<drive>:" for format a drive in enhanced
mode).

NOTE: 39 and 40 are the same. Also note the useage of AUX1 in the
"XIO 40" example.

---=== Getting Atari files to an IBM: ===---

Q.1) How can I read Atari disks on my IBM?
A.1.1) If you have double-density Atari disks, you can use the program
"Util" on the IBM which can read double-density Atari disks. Please
see the Atari 8-bit FAQ for more details.
A.1.2) If you have an Atari 1050 disk drive, you can use the program MULE
to copy files, one file at a time, 20k chunks at a time, from the
Atari to the IBM. You first must format a 180k disk on your IBM,
the run MULE on your Atari to get a file onto the MULE disk, then
run MULE on the IBM to get the file onto the IBM. Tedious, isn't
it? MULE wasn't meant to be a fully-functional program, just a
demo to show that this was even possible.
A.1.3) If you're fortunate to have a Black Box interface on your Atari,
you can get an external IBM drive and the Black Box's add-on, the
Floppy-Board and simply copy files from your Atari disks or hard
drive(s) onto IBM disks via the floppy board, then load them up
on your IBM.

Q.2) Ok, I can't do any of that, now what?
A.2.1) You can use SIO2PC, which is a program for IBM's which turns your
IBM into a set of Atari disk drives. You need the SIO2PC cable
(which you can purchase, assembled or unassembled, or buy parts
and build it yourself) and the SIO2PC software (available at UMICH).
Connect your IBM to your Atari, load SIO2PC, and then run the
program FILE2PC on the Atari to transfer files to the IBM's hard
drive. Or instead create a disk image within SIO2PC and copy files
from one disk (a real Atari floppy) to another (the SIO2PC image)
with the Atari or MyDOS "C"opy command. If you want to extract files
out of the SIO2PC disk image file and store them on your IBM's hard
drive or floppies as single files, either again use FILE2PC or use
S2PC, an IBM program which can extract files from or add files to
MyDOS-compatible SIO2PC disk images!
A.2.2) You can use two modems to download files from your Atari 8-bit.
A.2.3) If you don't necessarily want files that you already have on your
Atari 8-bit, you can download files from the huge collection
available at FTP sites and Atari 8-bit supporting bulletin boards
and save them onto your IBM.
A.2.4) If you have only one modem, so you can't connect both your Atari
8-bit and your IBM together via modems, you can do it via null-
modem, OR you can upload files from your Atari to some bulletin
board or account you have access to, and then connect the modem
to your IBM and download the files.

Q.3) Is there any easier way to get Disk Communicator (Atari disk image)
files to and from SIO2PC disk images other than using Disk Comm.
on my Atari! I mean, both files are disk images! They're both on
my PC's hard drive! <cry>

A.4) Yes! There's a (currently it seems buggy) new IBM program out called
DCM2DSK. (Why "DSK" and not "ATR", I don't know.) The current
version is '0' and it's available at UMich's archives and probably
elsewhere. Filename: "DCM2DSK0.ZIP" in the SIO2PC directory.

The Suburban Chicago ATarians (SCAT) user group will hold its October meeting on Tues. Oct. 18 at 7:30 PM (7PM setup), at the College of DuPage, Room K157 (the K building is located on 22nd St. just west of Lambert Rd., in Glen Ellyn). We will watch a video of the Summer Consumer Electronics Show, and we plan to have at least one demo (perhaps MagiX on a TT....).

Everyone is welcome to attend.

For more information, send me E-Mail at one of the addresses below. [If this article shows up outside the greater Chicago area, I apologize - the "chi" distribution may not work (at all sites) now. Say, if you're travelling to the Chicago area and will be free that evening, feel free to stop by!]

Nick DiMasi, SCAT President

>: Ok, so no fully equiped Unix on the atari 8-bit,
>: but what about a client to Linux ?

It should be trivial to connect the 8bit as a terminal to a linux box.
NFS is probably out of the question, though. :-)

>You mean like SLIPP? That would require a bidirectional modem handler.

Uh, that's SLIP. Or PPP, another common protocol used for similar
purposes.
I've never seen a UNIdirection modem handler -- sounds kinda useless.
Any useful modem handler would be bidirectional.

>The Atari's clock speed prevents reliable asynchronous RS232 data
>communications beyond about 19.2K BPS.

if SIO (with UltraSpeed and similar software) can go to 57600 or more,
why not RS232? How fast will the R:P: go?

> Bidirectional hacks would take
>even more power.

You and I must have different definitions of bidirectional.

> SLIPP accounts are slow at 57K connections, let alone
>19.2K.

Slow compared to a bus line or ethernet, but no slower than SIO.
Your perception of "slow" depends on what you expect, what you're used
to, and how much actual data is being transmitted. I can't see the 8
bit being very demanding on any of those.

> SLIPP is essentially a way to run your own Internet site, and
>every time you access something locally, it gets what it needs from the
>provider (or so I have heard). Therefore it is transferring massive
>amounts of data.

NO NO NO NO.
The great thing about SLIP, as least from the system administrator's
point of view, is that you run all the programs on your own machine,
and you can save files on your own machine rather than taking up disk
and processor resources of the server. It also allows a lot more
flexibility on the client side.
The downside is that the client must be capable of more than being a
dumb terminal.

A slow modem connection can be frustrating with SLIP if the client
requires a lot of information from the server, but this shouldn't be
much of a problem with 8bit stuff.

I'm using a SLIP connection now, and it's wonderful for mail, ftp,
gopher, and lot's of other stuff. Newsreading is the only thing I've
found to be much faster through a terminal connection, but now I can
have more than one term connection and other clients all running at
the same time.
Of course, this isn't my 1200xl. :-(

> The rather slow (compared to PCs) hard drive data rate
>is also a problem.

Why compare it to the PC?? Compare to the Atari's other options,
which are no faster.

> Lastly, the system requires a Unix OS overlay or at
>least some way to fool the provider and I think the possibility of doing
>this within the 8-bits memory limitation, even with a truly herculean
>banked ram system, would be impossible. Even with a 65816 it would
>probably be impossible to do this where it would actually be practical.

It doesn't have to be Unix or anything like it. (I'm suddenly reminded
of the news.newusers post that says that the Internet is not Unix.)
Nevertheless, there would be major software handler problems with
trying to do SLIP with the 8bit. I wouldn't call it impossible for
the 8bit without looking at some protocol specs, and I'm certain it
could be done with the 65816.

I can't understand why... I mean, budget cassettes starting at 50p, and no-one
is interested. Or are 88% of subscribers actually that skint?
Incidentally, they have some pretty good games for sale.
At this moment in time, I could understand if Page 6 felt like packing it all
in. Do people really want that to happen?

Note to Graeme Fenwick:

Um ... no ... Les Ellingham isn't one of the undead - i think. Have you tried throwing garlic at him, or shooting him with a silver bullet or whatever you do to vanquish the undead?

No, seriously, I might sound a bit pesimistic but my information comes from a _very_ reliable source who isn't usually open to spreading rumours. All I will say is that if Page 6 don't survive the next year, it will be because Les has metaphorically shot himself in the foot. However, I do hope that they do manage to continue but it is getting increasingly shaky for them.

5703. IRC meeting

Newsgroup: comp.sys.atari.8bit
Date: 1994-10-12 14:24:01 UTC
From: tatar@student.uci.agh.edu.pl
Message-ID: <37gri1$los@galaxy.uci.agh.edu.pl>
Source record: 97987

Hi, everybody!
Yes, we've got our IRC channel, but this is hard to meet anybody there.
I think that we should set any time for meeting few days before. That
gives chance that there will be more than two guys on channel. :-(
I think that the best day will be Friday (there are many other thinks
to do on the other days, and I haven't got access to the IntNet on
weekends (I think that many other people, too). There is also trouble
with hour. For me (and some other guys from Europe), the best hours
would be: from 3pm to 9pm, our time. Our time is Greenich+1h.
I'm not sure, but I think that it's about 6h diference between Europe
and some states in US. So, this time would be: from 9am to 3pm, your
time.
So, my suggestion is: Friday, 2pm - 8pm, GMT.

/me is confused by all these TIMEs

Of cource, it is only suggestions. I'm open for other ideas.
Please, post your comments.

If this Friday is too fast (you'll write this posting on Wednesday or
Thuesday), next Friday will be also fine!

See you!

: if SIO (with UltraSpeed and similar software) can go to 57600 or more,
: why not RS232? How fast will the R:P: go?

R:P: will support a 38k baud setting, but I doubt that Bobterm will go all the way up there and hardware handshaking will make actual throughput somewhere above 19.2K but not too far above.

Data rates are different from RS232 rates. There is more CPU overhead involved in pushing true RS232 signals through with the parity and the translation and all that, than there is moving raw bytes to a MIDI device or from a floppy. Not to mention updating the screen and servicing terminal interrupts and the like. It is a common misconception I think that if the Atari can support 57K off POKEY that we can all run terminals at full throughput as long as the interface is good enough. Now i think the Atari does an admirable job compared to the other 8-bit platforms, but I don't think it can put out RS232 at 57K in a realistic situation.

The thing with SLIP is that it isn't just one connection. Someone can telnet to your machine and use it just like any other unix dialup. This involves SHARING the modem line. The modem connection is therefore different from a simple connection. This is what I called bidirectional (meaning people can connect to you while you are still connected). Naturally throughput suffers as this happens, but since some connections will have idle time, some routine has to monitor the modem and make the best use of the line, ignoring idle ports and servicing busy ports. Like an RS232 LAN.

OtS> Or if you have any advice, let me know.

The "A" format is MYDOS' special "density and a half" format, known as "MYDOS Enhanced Density". This is not the same as ATARI Enhanced Density. Disks formatted by MS-DOS are not "density and a half", "enhanced" density disks. Disks formatted under an MS-DOS PC are --TRUE-- double density disks. MYDOS also has the capability of formatting in --TRUE-- double density. MYDOS true double density is the "Y" format of the "I" menu selection when "P" is set to "D". If D1: were set to double-sided, double-density you would see '1D=' at the top of the menu. To read an MS-DOS double-sided, double-density disk, you must have a double-sided, double-density drive. The stock ATARI 1050, for example, is unable to do this, whereas an ATARI 1050 with a US-DOUBLER upgrade --IS-- able to read these disks. Most ATARI XF-551 drives are also able to read double-sided, double-density MS-DOS disks. With the proper drive, you should be able to read an MS-DOS disk. Whether or not you can execute any programs depends on the language and CPU. ASCII text of minimal BASIC source code would probably be interchangable between machines. I don't know about using ATARI 6502 8-bit PC-emulators to read ATARI enhanced density disks, however.

OtS> And next... I usually use MyDOS4.53. It is very nice, easy to use,

OtS> But I want to compile program saved on MyDOS disk (sio2pc disk).

A HA! You are using the SIO2PC disk server! I think you need to run something called "image" files that end in ".ATR" . Anyone care to fill Odaman in? MyDOS should be able to read an AtariDOS disk, however there are problems with MyDOS running AtariDOS programs because the two DOSes are different sizes so LOMEM is different under each. For example, AtariDOS will be able to run AMS music files whereas AMS will not run under MyDOS, which was one of the impetuses (impetii?) for POKEY-PLAYER and AMP music.

You should have stated that this was an SIO2PC question at the beginning of your message. I don't know a lot about the SIO2PC. I wish I could be of more help....

From: mbitdc9306@newi.ac.uk (David Davies)

Right, here's the current info on Menu Print ....

WHAT IS MENU PRINT?

Menu Print is a disk cataloguer. No, don't laugh ... it's not one of those tacky PD Databases that call themselves disk cataloguers. This is the REAL McCoy!!

OK, SO WHAT DOES IT DO?

It reduces the amount of typing you have to do when creating a disk database with its ability to read several different types of menu and DOS disk. In fact, it's sooo good that it even has the ability to know which boot disk you've entered into the drive - so it can tell when you've just put Alternate Reality into the drive.

It supports Rob C, Multiboot, Howfen Menu 3 and K & D Menu disks as well as DOS 1, DOS 2, DOS 2.5, DOS XL, SpartaDOS 5.0, MyDOS 4.50, MachDOS, Atari Disk Utilities, Transdisk IV XT and Transdisk IV XL. OOPS --- I meant SuperDOS 5.0, not SpartaDOS ---.

When it finds a disk it supports, the contents are displayed on the screen and are selected simply by tagging the entries you want to catalogue. Also, anything that you have in your collection that is not supported can still be entered manually into the Database.

WHAT DOES IT COMPRISE OF?

Menu Print is split up into three main sections, each accessible from a main menu.

ID Library - This is where you can create your own boot disk recognition files so that Menu Print can recognise future software releases or those not covered on the free Library disk that will come with the package. Other Library disks will be released in the future.

Database - See above. Just undergoing last minute testing.

Printer - Last bit to be written. I've got about 3-4 weeks to write it. This will include label and list printers (hopefully I can add some sort of sorting facility into it).

WHEN IS IT GOING TO BE RELEASED?

AMS 8 in November - I hope. My drive's been corrupting disks left right and bloody center!!!!!!!

PRICE?

Dunno. Depends on how much it will cost to produce each copy but I hope it won't be too far off the 10 pound mark.

Any questions? ... :)

The reason I didn't order anything from Page 6 during the summer was that I was 100% skint. Even so, I'm not sure if I would have ordered anything since I only ever buy stuff I want and these days it's usually the odd bit of hardware. Even though they had many bargains available, they didn't really have much of great interest. With Derek Fern (Micro Discount) getting all the surplus stuff, they seem to be finding it increasingly difficult to add new items to their catalogue.

Hmm ... perhaps Derek should be reported to the Monopolies and Mergers Commission? :)

parity isn't necessary these days, and it is counted just any other
data anyway -- the parity bit usually takes the 8th data bit, leaving
7 data bits. Remember that we're talking about bits per second, with
each byte usually transmitted on RS232 as 10 bits. If SIO doesn't use
start and stop bits (does it?), the speed difference would seem to be
about 20%. (20% of what, I'm not sure :-)

>or from a floppy. Not to mention updating the screen and servicing
>terminal interrupts and the like.

That's already accounted for in the SIO speed. conversion to RS232
isn't even done by the Atari hardware.

>and make the best use of the line, ignoring idle ports and servicing busy
>ports. Like an RS232 LAN.

It is ONE serial connection, shared between different
applications. The sharing is controlled by software, and has nothing
to do with hardware.

The controlling software takes the information from various programs,
divides things into labelled packets (introducing some overhead) and
sends them out one at a time. It also receives packets, looks at the
markings, and gives them to the program they're addressed to. As far
as the serial hardwware is concerned, it's no different from a simple
BBS connection or something.
All (well, nearly all) modem connections are bidirectional -- it
doesn't matter who initiates the connection.

Also, nobody can telnet to your machine if you don't run a telnet
server program (or 'daemon' in the unix world). In this case, someone
sends a packet to your machine's telnet server, the server responds
and starts up the connection. If nothing on your machine responds to
the request, the sender gets an error, but you don't care because
you're happily FTPing files directly to your disk while telnetting to
your computer at work. :-)

I sent an email message to Darek. He said he's not quite done with it yet
and thinks it will still be another couple of weeks. He assures me that
it *will* ship soon, though, as he wants to get XF3 all done before working
on Gemulator. I suggest bugging him in email if you're still curious.
(Told him he should post a message here, but he believes there's no cause
for that yet.... I think he's been working at Microsoft too long...)

FWIW, I'm not worried about it yet and I assumed all along it would take
a month or so longer than he predicted.

Just curious if there are any folks out there who'd like to see the return of the Atari Connection BBS?

Also, the BBS will be running on a Hayes Ultra v.32 SmartModem. For some reason, it has difficulty hanging up - as DTR never drops.

My important modem settings are: &D3&S1&C1 Should I set the modem some otherway to do a good disconnect?

Any information, etc.. appreciated.

Computer: Atari 800/XL/XE

++++++++++++++++++
Title: Programer's Reference Guide for the Atari 400/800 Computers
Asking Price: $12.00
Authour: David Heiserman
Publisher: Howard W. Sams & Co. Inc.
Description: Programmer's Reference Guide for the Atari 400/800 Computers
- Introduces some of ther fundamental concepts of BASIC language
- Provides a ready reference for the Atar BASIC language
- Discusses the 8 differenct screen modes and their 21 variations
- Features the enchanced animation package
(player/missle/graphics) - Comvers the flexible I/O system
- Describes the memory map
- Contains the 6502 instruction set
- Covers the numbering system
- Hexadecimal-to-decimal conversion
- Decimal-to-hexadecimal conversion
- Binary-to-decimal conversion
- Lists Atari BASIC reserved words and tokens
- Gives Atari character codes
- Features the Atari keyboard codes
- Lists the error code numbers and their general interpretations
Computer: Atari 400/800

++++++++++++++++++
Title: Compute!'s Second Book of Atari Graphics (Graphics, utilities,
tutorials, programs and other helpful information form the users of
the ATari personal computers.)

Asking Price: $7.00
Author: Compute! Books Publication
Description: Like Compute!'s First Book of Atari Graphics, this book contains
many articles and tools that Atari programmers will find
extremely useful. And some full-fledged graphics utilities that
not only teach programming, but are also as exciting to use as
commercial computer art software.
The graphic utilities "Screenbyter" and "Fontbyter" are
designed to allow you to create, save, and add inticated graphic
displays to your programs in a fraction of the time it would
otherwise take.
But the book doesn't stop there. For instance, articles are
included that: teach the beginners a simple way to add color
to their programs, show the intermediate programmer how to use
player/missle graphics, and help the advanced programmer
protect memory from a BASIC program, as well as many more,
useful programs and articles.
Computer: Atari 400/800/XL/XE

please email: jonewby@uncc.edu if interested.
Thanks.

P.S. Eventhough some of these don't say so they should work with
the XL and XE computers.

5730. [FORSALE] Classic Atari Programming Books (400/800i/1200/XE/XL)

Newsgroup: comp.sys.atari.8bit

I have the following games forsale. They are brand new and most are
still in shrink wrap (obtained from flea market). They will be $5
each + $2 shipping this will include 2nd air for under two pounds.

7800 Games:
o Karateka
o Choplifter
o Xevious
o Pole Position II
o Hat Trick
o Ball Blazer
o Donkey Kong Jr.
o Robotron: 2084

2600 Games:
o Venture

e-me at: jonewby@unccsun.uncc.edu

TYPE:LOST
AREA:COMP.SYS.ATARI.8BIT

From: richczeta@aol.com (RichCZeta)

Atari 8-bit wantlist

Looking for 1 each of the following games, cartridge or disk format,
preferably with docs, for the 800/XL/XE. Also interested in 5200 versions
of some titles.

Vanguard
Mario Bros.
Donkey Kong Jr.
Star Raiders II
Pitfall II
QBert
Tutankham
Burgertime
Phoenix
Kangaroo
Moon Patrol
Battlezone
Xevious
Gyruss
Frogger
Frogger II
Star Trek
Jumpman Jr.
Sorcerer
Venture
Mr. Do!
Any Gauntlet except original
Dark Crystal
Crystal Castles
Blue Max?
Ultima III
Archon
Zaxxon
Time Pilot
Legionnaire

If ANYONE has a Crazy Climber to sell - 2600, 5200, or
8bit computer version, I want it! (Assuming it exists)
BTW, does anyone have access to the 5200 technical & user docs?

Also looking for a 1050 disk drive in excellent shape w/ps.

If anyone has anything to offer, email me! <RichCZeta@aol.com>

Andrew K. Heller (heller@akh104.rh.psu.edu) wrote:
: Now, what about a parrallel device? =)

You mean a PBI modem device like the BB modem port? Or do you mean hooking up one of those new modems with the parallel port to the printer port on an Atari interface? The BB modem interface doesn't really solve the problem with the Atari having to push formal RS232 data in and out.

Now, if we went ISDN, that might help a little. I'm not sure, it is all moot because there is no way the Atari will get SLIP software even if it WERE possible.

: BBS connection or something.
: All (well, nearly all) modem connections are bidirectional -- it
: doesn't matter who initiates the connection.

The fact that is is only one serial connection is why it is so friggen slow. It is doing the work that should be done by a T1 or ISDN. I think this whole thread is pointless. Even if you got it running on the Atari it would probably be so slow that it would take an hour to update your local newsgroups. Let me know when you finish writing SLIPA8 ;)

Not to mention the fact you'd not be able to do Mosaic, one of the benefits of these connections.

CIS users are #####.####@compuserve.com
Delphi users are delphiname@delphi.com
```

Telephone number coversion table:
2=ABC 3=DEF 4=GHI 5=JKL 6=MNO 7=PRS 8=TUV 9=WXY

When writing to request catalogs, it's always a good idea to include a Self-Addressed Stamped Envelope.

When writing to foreign firms, try enclosing a couple of International Reply Coupons (IRC's) as well.

Special thanks to Dave Paterson, GEn: D.PATERSON2, for his efforts at confirming the entire contents of this list in 1994!

==========

This list won't be accurate and complete without YOUR help!

Atari 8-Bit Stuff for sale:

HARDWARE:

Reset Button: Plugs into cartridge slot, $10.

SOFTWARE:

1) Pilot Programming Language
w/"Turtle" graphics, (Educators'
package), $10.

2) Sublogic FLIGHT SIMULATOR 2 plus JAPAN SCENERY Disk, $25.

3) Timewise (Time management), $9.

4) "Kingdom" (Instructions and
game, cassette), $3.

5) "Biorhythms", (Instructions and
game, cassette), $3.

6) "Super-Text" word processor
(disk), $4.

7) "Atariwriter" (Cartridge), 2 avail., $20. each.
Excellent word processor for Atari

8) and 9) SOLD

10) "Atari Spell Checker" for Atariwriter and Atariwriter+, $15.

11) "GO" (Ancient Japanese game, harder than Chess) $9.

12) "The Newsroom" $10.

13) "Movie Maker" (Animation Construction Set) $10.

14) "Proofreader" (Spelling Checker for Atariwriter), $15.

15) "Your Personal Net Worth", $10.

16) "Managing Your Stocks", $10.

17) "Softporn Adventure", $5.

18) "Pinball Construction Set", $10.

19) The following from XLEnt Software, $15 each, or all 5 for $65.:
(A full desktop publishing sytem for the 8-bit Atari)

a)Megafont II
b)The First XLEnt Word Processor
c)Rubber Stamp
d)Typesetter
e)Page Designer

20) Atari BASIC version "C" cartridge. Eliminates bugs in built-in version "B".

BOOKS ($3.95 each plus shipping)

Atari Programming with 35 Programs

An Atari in the Classroom

PLEASE ADD $5. FOR SHIPPING TO ALL ORDERS UNDER $35. I WILL PAY SHIPPING ON ALL ORDERS OVER $35.

All these prices are negotiable. I am especially receptive to package offers that move a lot of items!

****SPECIAL BARGAIN OFFER****: The items above total more than $250. IF YOU TAKE EVERYTHING---$125. postpaid.

Please reply by e-mail.

Hello all.

I remember the great ATARI from my childhood and I'm really longing for some of those great classic shoot the whole screen up video games. So, here's my dilemma:Is it cheaper to buy that emulator XF thing or just cheaper to buy the real thing: anATARI 65XE from Toad for 49$???

Thanks for any advice,

Justin

"High density" disks will not work in a single or double density drive!
You need double density (360K) disks. Also, if you format a disk in
single density with Mydos, Atari DOS should have no trouble reading it.

I think all you need is an "intelligent" RS232 interface, which does
it's own handshaking/buffering. Any volunteers to program a
microcontroller...? ;))

The output of text wouldn't be much higher than 19.2K, but if you were
transferring files, etc. you could get quite good results!

Bye,
Jochen

5757. Re: What's better: the emulator or the real thing?????

Newsgroup: comp.sys.atari.8bit
Date: 1994-10-14 16:39:33 UTC
From: Rick_Michael_Cortese@cup.portal.com
Message-ID: <124866@cup.portal.com>
Source record: 98014

IMHO: I'd definately wait for a review of the commercial version before dooing anything & wouldn't do anything without at least a 486 computer to run the emulator. I don't know for a fact, but at least on the freeware version, doing something like 'POKE 708,0' doesn't change the screen colors immediately, it appears to do a 'flood fill' type change of the screen to the new color. No where near as fast as a real 65XE. I'm just guessing, but I'd bet Dereck's doing the development on a pretty hot computer, 486DX something with maybe VLB video so he doesn't see the slow downs as much as someone with a 386. Adding the extra features to the commercial version will slow it down even more. There's a few other details you have to know before you commit to the emulator, for instance I only have an Ad Lib sound board & Dereck hasn't said what sound boards he is going to support. If you don't have a sound board already or have to upgrade your sound board, you could easily end up spending $100 just to get the thing to run. I'm probably more of a hard sell on the emulator then most. My obvious gripe is you can't solder on an emulator. My view on a good system to have would be a 65XE with a SIO2PC cable. There are circumstances where an emulator has it's place, like when you're at work & want to run a quick game of Planetary Defense on your lunch hour. FYI I may even buy his ST emulator because everything I've heard about it says it works better then the original. I only have a couple of ST titles I have to run, but the ST is so lame I think I'd prefer an emulator over it.

PC X-Former 3.0 costs $29.95, so it will be cheaper. No one knows how good it will be, as it's not been released. It's supposed to be 130XE compatible, support sound and P/M graphics.

The 2.0 release (available at atari.archive.umich.edu and others) is 800 compatible, silent, and many games don't run with it (no collision detection). But for non-game items it works quite well. Promises great things.

A 2.5 version which is 800XL compatible was announced on GEnie.

You could find a 65XE or 800XL (very similar) for less than $49. But you'll need a disk drive, or an SIO2PC interface (use a PC as a disk drive).

5760. RFD: comp.sys.atari.programmer

Newsgroup: comp.sys.atari.8bit
Date: 1994-10-14 19:44:58 UTC
From: lexicor@world.std.com
Message-ID: <37mn3q$dg5@rodan.UU.NET>
Source record: 97813
Cross-posted to: news.announce.newgroups,news.groups,comp.sys.atari.8bit,comp.sys.atari.st

Proposal for a new newsgroup
Request for Discussion: comp.sys.atari.programmer

by: Yat Siu (lexicor@world.std.com)

Group name: comp.sys.atari.programmer
Status: unmoderated
Distribution: world-wide
Summary: a newsgroup for the discussion of programming on the atari
TOS or 8bit computer and any clones or otherwise

Justification:

There are currently several comp.sys.atari.* newsgroups, however
none cover the aspect of programming questions. Atari Computer systems
(8bit, 16 or 32bit and clones) have various development tools from other
third party developers, some of which are very good. Atari Users require
a forum where they can ask questions about programming in any language.

This new newsgroup is also meant to encourage programming on the
atari and asking questions regarding programming. Very often programming
questions are asked in other forums, but they either don't get a reply or
ignored because it is not related to the topic. Atari Computers have got
a user base of programmers who need to support each other on the usenet on
a more global scale, and it should also help third party developers for
atari development tools read and see what programmers use/require/want.

Charter:

The proposed group will provide a forum for the discussion of
programming queries, discussions of techniques or anything else that is
related to programming on the atari for any language that exist on the
atari (scheme, gcc, c, basic, pascal, assembler etc.)

NOTE

This RFD is being issued in concordance with the guidelines set in the
"How to create a new usenet newsgroup" FAQ regularly posted to
news.announce.newgroups. Please refer to this article if you have any
questions about the newsgroup creation.

Unless the discussion indicated a need to resubmit a new RFD, the CFV will
be posted approximately three to four weeks after the posting of this RFD.

This RFD was (cross)-posted to the following groups:

news.announce.newgroups, news.groups, comp.sys.atari.st,
comp.sys.atari.8bit, comp.sys.atari.announce and mailed to the gem-list
and lexicor-list

5761. Atari Hardware Project

Newsgroup: comp.sys.atari.8bit
Date: 1994-10-14 21:05:41 UTC
From: REASERRL@POST2.LAAFB.AF.MIL
Message-ID: <2E9EB16C@POST0.LAAFB.AF.MIL>
Source record: 98004

Brian Furbee recently asked:

1. Is there a way to interface to a PC/AT Keyboard?

Yes. Chuck Steinman of Dataque/Lexicor has a product called Transkey that allows you to do that. I think Mike Todd did a review of it in Current Notes a little while back. Works great from what I understand.

2. Is there an extender cable for the Cartridge Port so I can port a cartridge cut-out on the PC case?

Sorta. You can use a standard ribbon cable connector for the XL side. You may not be able to find one with the exact number of contacts, but you can slide it to one side and that should work. I believe that length of that cable off the cartridge port could be a limiting factor. (It is for the PBI

on the back.) As for the cartridge connector on the other end, those are hard to come by. You can try Best Electronics or call Mike Hohman at FTe. He uses those kind of connectors in his R-Time 8, SDX and Express! carts. He might sell you one. Then of course, you'd have to mount the thing. You

might be able to use a dummy one of FTe's stackable cartridges, if you just want to extend the plug a couple of inches. That sort of depends on how the

mother board is oriented in your tower.

5762. ATR-8000 Manuals

Newsgroup: comp.sys.atari.8bit
Date: 1994-10-14 21:36:26 UTC
From: REASERRL@POST2.LAAFB.AF.MIL
Message-ID: <2E9EB174@POST0.LAAFB.AF.MIL>
Source record: 98006

Re: Ryan Osborne's post on csa8.

The ATR-8000 manuals are about 120 pages. One is
the C/PM manual. I'll xerox and mail for $15. (That's what I figure it
will cost plus postage. The manual pages are double sided, so I would need
to go to a copier place that can copy double sided stuff.)

5763. Sound Monitor 1.2 HELP

Newsgroup: comp.sys.atari.8bit
Date: 1994-10-14 21:59:16 UTC
From: KENDRICK@sonoma.edu
Message-ID: <941014145927.2404c86b@sonoma.edu>
Source record: 98007

I have a few questions about SoundMonitor Professional 1.2 by Torsten Karwoth.

First off, when editing a sound (in the "Spectrum Analyzer", the first editing option), the documents (by Shawn Poulsen(?)) say that pressing [SHIFT]+[,] and [SHIFT]+[.] change the distortion (part or all of the "VC" number on the right in the upper middle) but nothing happens when I press those keys! What am I doing wrong!?

Secondly, when one creates a pattern and saves it to the data table from the "Pattern" editor (second editing option) with the [SHIFT]+[TAB], the first time you hit [SHIFT]+[TAB], the pattern is stored to the data table (in the lower middle) as "01". EVEN if I don't edit the pattern at ALL and save it again to another place in the data table with [SHIFT]+[TAB], it gives it a NEW NUMBER!? ("02", then next time, "03", next "04", etc.!)

How does one actually EDIT the data table! The "Data Table" (third editing option) area seems to not be an editing utility, but just a way to select a place in the data table (from there you can go to PLAYING and play it, or stay in EDITING and mess around with [SHIFT]+[left] and [SHIFT]+[right] while in the Pattern Editor and do the same thing, select a different place in the table).

Sooo... can anyone help me!?

Also, is there a less jumpy / flickery and English version of SoundMonitor?

I loaded the whole "SMON.COM" into TextPro and went in and changed most of the German into English if anyone would like me to UL a copy to UMich or something.

If what system I'm using matters, here's my setup:
Atari 1200xl
800xl / 800 OSes (switched in 800xl mode)
256k RAMbo (192k MyDOS Axalon (I think) style RAMdisk)
MyDOS 4.53/4 (unfortunately the 4-digits mess up the disk directories, but that doesn't matter much to me.. also, there was a 3-or-so POKE fix for changing 4.53/4 'into' 4.53/3... BUT.. I lost the damned paper which had that printout. It was originally posted MONTHS ago (a year or so?))

Anyways.. thanx in advance. Boy, this is the nicest looking post I've made in a while, if I do say so myself! :)

I'm sorry. But...
I won't let my XL go. It has endured too much with me. But I am interested
in how much you would sell the 320k XE for. You can contact me here or at
DELPHI (I know you know where that is) as TODLEE

5768. Re: What's better: the emulator or the real thing?????

Newsgroup: comp.sys.atari.8bit
Date: 1994-10-15 07:10:31 UTC
From: darekm@microsoft.com
Message-ID: <CxpD9L.KBF@microsoft.com>
Source record: 98016

In article <37l024$1r7@solaris.cc.vt.edu> justinad@vt.edu (Justin Davenport) writes:
>Hello all.
>
>I remember the great ATARI from my childhood and I'm really longing for some of
>those great classic shoot the whole screen up video games. So, here's my dilemma:
>Is it cheaper to buy that emulator XF thing or just cheaper to buy the real thing: an
>ATARI 65XE from Toad for 49$???
>
>
>Thanks for any advice,
>
>Justin

That "XF thing" first of all is not a 65XE emulator. It is a 130XE
emulator with 256K expanded memory. So it all matter if you'd like to
spend $49 for a 64K 65XE, or $29.95 for a 256K 130XE emulator that,
depending on how fast your PC is, runs several times faster than the
65XE. Your choice. <grin>

By the way, several people have sent email asking, and no, PC Xformer 3.0
disks have not been mailed out yet. It is still in beta testing, and
has been for the last couple of months. I hope to ship it in the next
few weeks. If I've already cashed your check or charged your credit
card please be patient a while longer, or send me a note if you'd like
a refund. The advertized ship date of PC Xformer 3.0 was end of September
so at this point it is only 2 weeks late and I think some people have
made a big deal out of something they needn't.

- Darek

p.s. - by the way, the 256K 130XE emulation is a feature added to the
product not originally planned and one reason for the delay. I think
when you try it you will agree it was worth the wait.

5771. .xmo files?

Newsgroup: comp.sys.atari.8bit
Date: 1994-10-15 07:50:12 UTC
From: wmcbrine@clark.net
Message-ID: <37o1jk$b5u@clarknet.clark.net>
Source record: 98050

Hello, I'm new to Atari 8 bits.

On one of the Atari FTP sites, I found some files with an .xmo extension. What are they? I'm guessing it's short for Xmodem, but that doesn't clear it up much. And from the context, I think they might be pictures. (?)

It's probably just an older file, way back in the dark ages when things
were anything but ASCII people would put the .XMO on the end to indicate
it was anything but ASCII & needed to be transmitted as a binary file.
So... could be an .ARC, .PIC, .OBJ, .COM, .anything.

5781. 8-bit as a Polygraph

Newsgroup: comp.sys.atari.8bit
Date: 1994-10-16 03:45:35 UTC
From: toastman@armory.com
Message-ID: <37q7kv$bc8@nic.scruz.net>
Source record: 98029

I remember downloading some odd program from the Pandora BBS called "Liedtect.bas"... apparently someone built a polygraph for the Atari. Unfortunately, no one included the schematics.

Does someone have that issue of ANTIC, and could that person please tell me how to get this issue or how to actually build this lie detector (not to infringe the copyright, but perhaps someone has, eh, improved upon the design to the point where it isn't the copyrighted one, eh?)

That would be neat.

Source record: 98027

hl: : if SIO (with UltraSpeed and similar software) can go to 57600 or more
hl: : why not RS232? How fast will the R:P: go?

hl: R:P: will support a 38k baud setting, but I doubt that Bobterm will go
hl: all the way up there and hardware handshaking will make actual throughp
hl: somewhere above 19.2K but not too far above.

hl: Data rates are different from RS232 rates. There is more CPU overhead
hl: involved in pushing true RS232 signals through with the parity and the
hl: translation and all that, than there is moving raw bytes to a MIDI devi
hl: or from a floppy. Not to mention updating the screen and servicing
hl: terminal interrupts and the like. It is a common misconception I think
hl: that if the Atari can support 57K off POKEY that we can all run termina
hl: at full throughput as long as the interface is good enough. Now i thin
hl: the Atari does an admirable job compared to the other 8-bit platforms,
hl: but I don't think it can put out RS232 at 57K in a realistic situation.

not a well known fact, pokey can transfer data at half the cpu clock
speed, 895000 baud, but the processer cannot keep up with that speed for
long. pokey takes 20 cpu cycles to receive 1 byte at 895000 baud. in 20
cycles, the cpu must update its pointers, have cycles stolen for memory
refresh, do vbi's etc. it is possiable to do 128 byte blocks at this speed
but everything must be turned off in order to do it and timing is very
critical, this assumes that the sio lines to/from the computer are clean.
not very practical.
SIO speeds up to 69000 baud (indus gt high speed burst mode) has been
done for 10 years now with vbi's (critical vb routines) happening. term
programes may JUST be able to keep up (open minded on this one).

IF a parallel device was used, higher baud rates may be able to be used if
an data buffering uart was used...

DlQuoting from: krishna@max.tiac.net (Glenn M. Saunders)
GM>
GM>IMHO the XF-551 is the best double density drive and if one is going t
GM>be stuck with only floppies, the dual 720/360K system is really choice
GM>because you also gain the ability to read/write MS-DOS format disks in

note: read only. I totally agree. the duel drive is goooood. It is the
quickest sio drive i have come accross. try copying disks with it.

GM>common format (3.5" 720 rather than 360 or 180K 5.25"). Many computer
GM>these days don't even have 5.25" drives. But as long as you can do 3.
GM>MS-DOS you can pretty much share files with anybody. MACs and AMIGAs
Dland
GM>workstations like Sparcs can read/write MS-DOS using various means.
GM>You'd never have to set up a null-modem again.

Dl I like the XF 3.5 upgrade, but it is too bad one cannot write to IBM
Dlformat disks as well because of the memory limitations of the XF drive
Dlitself.
DlToo bad there isn't an easy way to do this though...

I have some specks on the processer in the xf551. It is capable of
accessing 64k of memory. If someone could put in a 2k static ram chip, then
the xf551 could read ibm disks. It is not hard to do. I may be able to do it
if i had an assembler for it........

DP> ...none of the Analog authors around have received notice...
DP> ...If the price were low enough someone could buy the rights and
announce, publicly and clearly, that all the files are PD...

I don't think the problem with ANALOG was whether or not files could
be circulated, since I believe there is a notice in the magazine that
supposedly states that files could be circulated. I believe the question
was whether or not the --DOCUMENTATION-- could be posted. (Specifically
the question was, "Why is T:EDIT never posted with "official"
documentation?") My understanding was that executible code was circulated
as an incentive to buy the magazine, as more money would be saved in free
advertizing than would be made from the miniscule volume of
"disk subscriptions". (Feel free to correct me if I am mistaken, as my
interpretation derives mostly from secondhand sources.)

5787. Almost broken drive belt in my 1050

Newsgroup: comp.sys.atari.8bit
Date: 1994-10-16 07:35:00 UTC
From: jasonbar@bolt.ucsb.edu
Message-ID: <37ql34$ghs@bolt.ucsb.edu>
Source record: 98035

My 1050 disk drive pooped out today.
Took it apart and found that the rubber belt that goes around the
motor "pulley" and the disk spindle disk thingy just fell off.
Put it back on and it works.
However, there is one segment of it that is mighty thin and a little
chunk of it actually fell off. I'm sure its days are numbered--that
section's gonna snap before long.
Anybody got replacements or know where I can get one? Just find a
rubber band that's the right size? :)

I'm interested in the swap of an upgraded 800xl for the upgraded 130xe.
We've worked a swap before so this will be no big deal.
Two questions:
#1 How much additional RAM does the 130xe have?
#2 Is it a 256K RAM 800xl your looking for?
I know this is short notice for both of us but on Tuesday or Wednesday I will
be incommunicado for about 3 weeks; therefore, timing is of the essence unless
you can wait until I return and we can work out the details then.

5796. Atari reference card

Newsgroup: comp.sys.atari.8bit
Date: 1994-10-16 22:40:34 UTC
From: rfunk@magnus.acs.ohio-state.edu
Message-ID: <199410162239.SAA21676@postbox.acs.ohio-state.edu>
Source record: 98039

I know you all think I forgot about that reference card I said I'd type in a few months ago, but I didn't, I just got really busy. I have a lot of it done, but I had hoped to wait until I at least had the error codes done before posting it anywhere, especially since it was an error code question that first prompted me to start typing this thing. It doesn't look like I'll get to do much more with it until November or December, so I'm letting you know now what I have done:
Atari BASIC commands
Atari BASIC functions
Color codes
I/O devices
Joystick codes
6502 mnnemonics (just what each instruction does)
Useful PEEKs and POKEs (well-extended over ANALOGS list)
Player/Missile memory area layout
Sound codes
XIO codes (thanks to Bill Kendrick for help with this one)

Most of these are at least a little better than what was in ANALOG's original reference card.

Remaining to do:
Error codes (top priority)
Character code translation table -- characters, ATASCII values, keys, keyboard codes, assembly codes
(any suggestions on how to include both ATASCII and ASCII characters in this one?)
Internal Keyboard codes
Character set chart
Graphics mode specs

I'm trying to keep all this in printable 80-column format, but the graphics mode chart could present a problem because it's so wide. The character code chart will have the same problem, plus printing the actual characters will be a problem, especially since I think it should also show the ASCII equivalent characters. I welcome any ideas on how to solve these problems.

I haven't looked at the recently-uploaded "REFMAN" yet, so I don't know how much is duplicated there.

Since I'm doing this in 80-column format, it isn't quite as compact as the original card was. Until I can be sure that all Atari people have compatible graphics printers, there's not much I can do to solve this.

If you would like any or all of what I have so far, let me know. I have each of the above listed sections in a separate file, ATASCII or ASCII

format, and I have an ARC of all the ATASCII files. Also tell me if your
mail program can handle MIME or BinHex file attachments, since that's the
easiest way for me to send files. I can also do uuencoding or straight text
inclusion, though. As I said before, I'd rather wait until I have more done
before sending this to the archive.

5797. [--- XFTOOLS.DCM ---]

Newsgroup: comp.sys.atari.8bit
Date: 1994-10-17 08:17:08 UTC
From: winston@merk.com
Message-ID: <Cxt5oM.I4@merk.com>
Source record: 98043

The collection of XFTOOLS on the Atari Archive would not unpack under Disk Communicator 3.2 . It generates a Disk Error #139 on my stock 800XL using an XF551 (which is at least three feet away from the monitor, an AMDEK COLOR-1). I had the same problem when trying to unpack the TEXTPRO beta TP512X from the archives to read the documentation about the add-in modules.

Question: Are these .DCM files bad ?

I heard a rumour that DiskComm 3.2 was a MYDOS utility and that it would only work correctly after MYDOS had been loaded and it was under the MYDOS environment. Is this true? Could that be what the problem is? Since I own a floppy drive and have never needed time-stamped files I use primarily MYDOS. I have never used DiskComm 3.2 under SPARTADOS before. Is DiskComm 3.2 a "use under MYDOS only" utility or is this a myth? I know that DiskComm can --WRITE-- any type of disk format, but does it need to be --RUN-- under MYDOS ? Could the uploaders have created a bad .DCM file by using DiskComm under SPARTADOS ? (It was my understanding that Bob Puff wrote DiskComm before he had access SpartaDOS ?) Thank you.

5798. percom drives

Newsgroup: comp.sys.atari.8bit
Date: 1994-10-17 09:58:32 UTC
From: Masstorage@closer.brisnet.org.au
Message-ID: <625_9410170504@softtech.brisnet.org.au>
Source record: 98042

alWell, I opened the drive up to look for some dip switches but found
alnothing. Maybe this drive is a cheaper model. I does have the printer
alport and what looks to be a connector for another drive. The problem
alis the power supply first goes to the controller board which then powers
althe drive mechanism and there's only 1 connector for a drive. There is
alspace and mounting holes for another 1/2 height floppy though. It is
alpretty strange that there isn't even a switch for setting the unit as
aldrive 1 or 2. I think I'm gonna give up for now.

bmI believe that on Percom drives you set the drive number by moving the
bmdrive select jumper on the drive board. There should be some pins marked
bmDS0, DS1, DS2, DS3 near the edge connector. One of these pairs of pins
bmshould have a jumper between them. And Radio Shack sells Y-connectors
bmfor standard disk drive power plugs.

The one and only percom drive i have seen had 2 double sided double density
full hight drive mechs in it tipped on there side (big box). The back of the
case had a hole with 4 dip switchs in it and an edge connector hanging out
the back. 2 other standard drive mechs could be plugged into the edge
connector, either 360k or 720k 3.5" drive mechs. To change the unit number
of the 2 drive mechs built in to the box, look near the 34way ribbon cable.
you should see some dip switches or a set of jumpers. (the one i saw had 8
dip switches on each mech) set ds0 on the one to be number 1 and ds1 on the
one to be number 2. external ones must be set to ds2 and ds3. please note
that some start numbering at 1 and go to 4, others may have d instead of ds.

In the one i looked at, the drive mechs were not working properly. I
replaced them with a couple i found in a trs80. although the 2 replacement
drives were only single sided, it still worked well. (the owner used only
single sided any way). I could have fitted 4 1/2 high drives in the space
provied but i didn't have any at the time. Just about any 360k or 720 k
drive mech will work, even the one in the xf551. (more reliable too)

(W. Smith says he's having problems using diskcomm 3.2.)
Error 139 is a device NAK. But probably you have another
corrupted file or files. DiskComm 3.2 definitely works under
SpartaDOS 3.2, I use it frequently. This problem of corrupted
files is showing up oftener and oftener. I wrote a crc16
program that gives a crc checksum and I intend to include
it in my Unzipper (Yes I'm still working on it.) I am not
including the crc32 in the unzipper because of speed and
time to program it. But the crc16 as a separate program is
what I'm hoping people will use. It makes a data file of
the crc's and people can check the unzipped files. I think
dcm files should be archived and a small crc16 file put
with it to make sure the dcm file has not been corrupted.
This would also result in a smaller file than a dcm32
file by itself.

Hmmm ... For once I agree with Graeme Fenwick. The old Atari User magazine was very welcome but it simply didn't feel right somehow. I think it was more to do with the fact that they tended to be far more cheerful than the situation demanded - especially in their news section. I recall one time when they said that Hewson's hit game 'Nebulus' was on its way for the Atari 8-bit. In the end it came out on the ST! Not great attention to detail, huh?

The biggest problem with the old Atari User magazine was like I say, too much hype on the part of the magazine which used to sell itself, the current crop of software and non-existent pieces of software. At least Page 6 have their feet firmly on the ground and have some idea of the real situation.

I know, that's why it'll take more effort to get all the error
messages. I want to include them for all popular DOSs and programming
languages. It'll probably be December before I have time to collect
them all.

To keep it short, no. At the original developing of Disk Communicator
they wern't sure that it would understand SpartaDOS files, but it does.
If a disk were formatted in a non-Atari format then it would have problems.

Error #139 is Device NAK (Not Acknowledged), This is a message you'll get
when trying to read an incompatible DOS or disk not in place.

So if the disk was formatted under MyDOS then use MyDOS, if it was formatted
under Atari or SpartaDOS then use SpartaDOS.

I don't think SpartaDOS understands MyDOS, but I am not sure about that, it
might now.

5807. Please help - Connecting 800xl to 1050 drive

Newsgroup: comp.sys.atari.8bit
Date: 1994-10-17 23:02:58 UTC
From: jcwilets@students.wisc.edu
Message-ID: <jcwilets.112.2EA3029F@students.wisc.edu>
Source record: 97682

I was wondering if anyone out there would be able to help me out. I have an old Atari 800xl system with an Atari 1050 floppy disk drive, but I don't have the I/O cable that connects the two (it looks like 13 pins on each end). I stopped by a Radio Shack, but the guy said they didn't have anything like that, and didn't know where I could get the cable.

Does anyone know where I might be able to find something to connect the drive and the computer? I found a bunch of old floppy software that I owned years ago and would love to try some of it out again. :-)

Please e-mail if possible...if not, I'll keep my eyes on the newsgroup.

Thanks much!

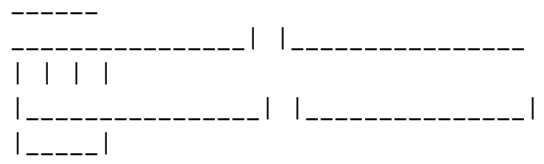
From: bob_s2@sfov1.verifone.com
Message-ID: <1994Oct18.064004.1703@sfov1.verifone.com>
Source record: 98052

Atari Wizards:

I dusted off my 810 (don't laugh) the other day and found that it still works - well sort of - it will format and read diskettes but it will no longer read diskettes formatted on another drive. Obvious problem, out of alignment. Does anybody know how to adjust the alignment on this sucker? I have another drive to format disks and test if I got it right, but where is the adjustment made?

Oh, yeah, it is the 810 with the long thin slot and the small door in the middle, NOT the one with the big wide slot with the big door that goes all the way across. See crude pic below.



Any ideas, instructions will be appreciated. Thanks.

Bob (bob_s2@sfov1.verifone.com)

In a previous article, Masstorage@closer.brisnet.org.au (Masstorage) says:

>alWell, I opened the drive up to look for some dip switches but found
>alnothing. Maybe this drive is a cheaper model. I does have the printer

If anyone is interested, here is a letter I wrote to a guy on how I
convert my percom drives to higher capacitys.

Steve
--

>The model number is AT88-S1PD. It just has one drive in there.
>I can format it in single density just fine but that's about
>it. There aren't any dip switches but there is a 34 pin connector
>and an edge card connector for a printer I think. Is it possible
>that this is only a single density drive? The drive mech. is
>a Tandon I think from the last time I opened it. I think you
>said something about getting a y-connector to handle 2 drives.
>Wouldn't that put a strain on that little power supply inside?
>Just wonderin'. Well, I stop blabbing now. Thanks for any help
>you can give me.

You have the Single Density version of the Percom drive. But ALL percom drives
support DOUBLE SIDED 80 TRACK OPERATION. You can still hook up and 3.5"
drive but you will only get 360k instead of 720k. All Double Density
models are serial numbered RFDXX-sY where XX is the number of tracks
on the mech ORIGINALLY installs, and Y is the number of SIDES on the mech
originally installed.

My percom w/ 720k mechs is labeled RFD40-S1. It originally contained a
FULL HEIGHT single sided 40 track drive. A real beast to remove.

The Tandon Mech inside MAY be a single sided 40 track mech, which was top
of the line at the time it was made, but the controller will support 80
tracks DS.

The 'EDGE CONNECTOR' sticking out the back is a pass through connector to
hook up more floppies. To convert your drive to 3.5" mech do the following:

1: open the drive and REMOVE THE 5.25 mech and toss it in the trash ;)

2: REMOVE THE EDGE CONNECTOR BOARD and the cable that connects it to the
main controller board, there may also be a single ground wire running
from the card to the controller/power supply. Cut this ground wire and
remove the edge connector board. You can discard the edge connector board,
you will never need it again.

3: Buy some 720k drives. Dont bother with 1.44Meg drives, they will just be a waste of cash since you will only get 720k. The Percom does not support the higher transfer rate used in 1.44m mode. (Since it didnt exist when the controller was made ;)

4: This is the tricky part. You will notice the drive connector on the main board is the exact same type as on a regular IBM floppy drive board!

If you just want 1 360k drive just go get a regular PC internal floppy drive cable for $1 and plug one end into the board and I end into the 720k drive. If the cable you get has connectors for 2 floppies on it and a twist in the wire near the middle, DO NOT USE THE PORTION OF THE CABLE THAT IS TWISTED, USE ONLY THE 2 CONNECTORS BEFORE THE TWIST.

If you want more than 1 3.5" drive, get a STRAIGHT THROUGH cable that has no twist and more connectors. The Percom Controller wont work correctly with PC type cables that contain the twisted wire pair.

You can build your own pass-through cable from parts from Radio shack if need be, just get regular 34pin connectors and a ribbon cable.

5: Power supply considerations. The 3.5" mech will need an adapter to draw power from the large 4 pin connector on the Percom power supply, this is a STANDARD PC POWER ADAPTER and should come with your drive. If it does not it costs $2 at radio shack.

If you want to power more than 1 drive get a standard PC POWER SUPPLY Y-splitter. The power drain of 2 3.5" drives in my Percom is roughly only 2/3 of the draw of the single old FH drive. No need to worry about toasting the power supply. If you want more then 3 drives hooked upto the unit (it will support 4-8, depending on the 3.5" drive types) I would suggest you invest in a cheap PC power supply.

6: Drive selection. Drive number selectionis handeled from the drive unit exclusivly on SD units, set the jumper on the 3.5" drive to D0 or 'Drive A' or whatever is FIRST.

7: Once you get the drive powered and connected, its time to give it a test. Turn on the drive, carefull not to let anything metallic come in contact with the main board.

If all is correct you will hear the drive motor spin for about 2 seconds and the BUSY light on the front will flicker for 2-3 seconds and then go dark.

If you oriented one of the cable ends backwards (easy to do w/ a homebrew cable) the drive light will be lit forever when you turn on the drive and WILL NOT GO OFF. The motor may also spin forever. This will NOT harm the drive or controller, just reverse one end of one of the cables and try again.

Hook the drive to a computer and power on the drive, after the light goes off turn on the computer. If you hooked up the power supply, drive cables and drive selector CORRECTLY the drive BUSY light should come on as the Atari tries to boot from it as normal.

Turn both units off.

8: You now have a perfectly good 360k drive! ;) Just get MyDos loaded, hook
up the drive and use the configure option to set the drive controller
to 2 sides, 80 tracks, SINGLE DENSITY. the seek time should be set to
the fastest possible (0 if I recall).

Its been awhile, but I think the options go: High Capacity: NO
Configurable: YES
Double Sided: Yes
Tracks: 80
Seek: (fastest)

9: Format a disk at this density, it takes quite awhile. Write DOS/DUP and
you now have a bootable 360/720k disk!!!! These drives are real
speed demons in SD too, you will love that!

These drives work fine w/ SpartaDos as well (no ultraspeed).

The only modification to the above directions for DD drives is that the RDF
drives have dip switch settings to control the 'drive offset'. You can adjust
these so that physical drive 1 is atari drive 5, etc. these switches are
not present on any of the SD drives I have owned.

For Once?... I don't recall having any vehement disagreements, but
anyway...
It was the whole tone of the magazine that sometimes grated. The Nebulus
article was just one example- they seemed to pick up on anything and print
it, even when it was obviously meant to refer to the ST...

: The biggest problem with the old Atari User magazine was like I say, too
: much hype on the part of the magazine which used to sell itself, the
: current crop of software and non-existent pieces of software. At least Page
: 6 have their feet firmly on the ground and have some idea of the real
: situation.

Quite a few times, when there wan't any new software out, they'd review some
old stuff, *years* old in some cases, and make out it was new.. perhaps just
to keep people interested in their machine and buy the mag. I also felt that
some of the reviews, especially towards the end got patronising- they kept
saying things like how to load the game, when it was the same as any other
time, and so on ("Hold down START and OPTION"- I KNOW!!!!!!).
Like I said though, the hype was annoying too, both self-promotion, and
the above examples. I don't know why, but Page 6/NAU never seems vacuous in
the same way.

Having said that, if the mag was still being produced, I'd still buy it- there
was some good stuff in there!

5816. MASSIVE AUCTION IV -- includes Atari 8-bit, and other Atari

Newsgroup: comp.sys.atari.8bit
Date: 1994-10-18 19:19:20 UTC
From: dw901@cleveland.Freenet.Edu
Message-ID: <38173o$261@usenet.INS.CWRU.Edu>
Source record: 98054

MASSIVE AUCTION IV:

I finally had a chance to sort through all my stuff, and so this is a rather large file. If you don't like large files, and/or auctions, please stop reading now. You have been warned!

I will post updates every 36 hours, and delete the last update at that time.

Mike

PLEASE READ THE AUCTION RULES AT LEAST ONCE BEFORE PLACING BIDS.

NOTE: I will use the first part of your E-mail address when listing bids.

****

Games and/or game systems included in this auction are:

ATARI 2600 ATARI 5200 ATARI 7800 ATARI LYNX
ATARI 8-bit games ATARI computers COLECOVISION COMMODORE 64
INTELLIVISION ODYSSEY2 PONG (VARIOUS) TOMY TUTOR
SEGA MASTER SYSTEM TEXAS INSTRUMENTS TRS-80 COLOR COMPUTER VECTREX

AUCTION RULES:
1) THE DEADLINE FOR BIDDING IS 11:59 P.M. EST, ON WEDNESDAY, OCTOBER 26TH.

2) MINIMUM BIDS ARE LISTED FOR EACH ITEM UP FOR AUCTION, MINIMUM INCREMENTS ARE $0.50 ON GAMES AND $1.00 ON SYSTEMS.

3) BUYER PAYS ALL SHIPPING COSTS.

4) NO PACKAGE DEALS ON GAMES OR SYSTEMS.

5) TRADE OFFERS WILL BE ENTERTAINED, BUT CASH OFFERS ARE GIVEN PRIORITY (UNLESS THE TRADE OFFER INCLUDES VECTREX GAMES OR SYSTEMS!).

6) EVERYTHING IS SOLD AS IS. UNLESS SPECIFIED, ALL GAMES AND SYSTEMS HAVE BEEN TESTED AND ARE IN WORKING ORDER.

7) IN CASE OF TIES, FIRST BID RECEIVED WINS.

8) IF YOU ARE THE HIGH BIDDER ON AN ITEM, YOU ARE EXPECTED TO BUY THAT ITEM. DON'T PLACE A BID UNLESS YOU ARE PREPARED TO BUY WHAT YOU BID ON.

9) IF YOU DON'T FOLLOW THROUGH ON A BID, YOU WON'T BE ABLE TO PARTICIPATE IN FUTURE AUCTIONS.

10) PAYMENT MUST BE MADE IN U.S. FUNDS, DRAWN FROM A U.S. BANK BRANCH.

NOTE: ALL CARTRIDGES ARE LOOSE (IE. WITHOUT BOX AND MANUAL), UNLESS SPECIFIED.

HARDWARE:

NOTE FOR THOSE BIDDING ON SYSTEMS: If you are the high bidder on certain
systems (they are marked) you will have the option of buying a brand new RF
switchbox for $5 that is virtually identical to one sold at Radio Shack for $7.
It allows for the connection of both 300 OHM and 75 OHM antenna lead-in's.

If you already have an RF switchbox, most systems will work fine with it. Some
systems still include one, please read carefully. I just ran out of used RF
switchbox's in the last MASSIVE AUCTION, sorry.

LOT #1 - THERE ARE 3 OF THESE SYSTEMS AVAILABLE, THE TOP 3 BIDS ARE LISTED.

NEW RF SWITCHBOX PURCHASE OPTION

ATARI 2600 SYSTEM (4-SWITCH DESIGN), WITH TWO (2) ATARI JOYSTICKS, ONE SET OF
TWO PADDLE CONTROLLERS, POWER SUPPLY, AND SIX (6) GAMES [NO BOXES, OR MANUALS
FOR GAMES]:

ASTEROIDS (Atari)
BREAKOUT (Atari)
COMBAT (Atari)
HOME RUN (Atari)
SPACE INVADERS (Atari)
SWORDQUEST: EARTHWORLD (Atari)

THESE ARE COMPLETE ATARI 2600 SYSTEMS, EXCEPT FOR RF SWITCHBOX.

BID #1) MINIMUM OPENING BID OF $25.00
BID #2) MINIMUM OPENING BID OF $25.00
BID #3) MINIMUM OPENING BID OF $25.00

*****

LOT #2 - THERE ARE 3 OF THESE SYSTEMS AVAILABLE, THE TOP 3 BIDS ARE LISTED.

5817. Infocom interpreter

Newsgroup: comp.sys.atari.8bit
Date: 1994-10-18 20:11:23 UTC
From: jlodoen@shell.portal.com
Message-ID: <381a5b$7vn@news1.shell>
Source record: 97655

Has any enterprising programmer attempted to port an Infocom game
interpreter to the 8-bits?

Let me explain. Activision released The Lost Treasures of Infocom
a few years ago for MS-DOS, Macintosh and Amiga. But it's quite easy to
extract the p-code for the game.

Meaning the Atari ST, Unix, and even the Psion series palm-tops
can run these classic games. C source for these interpreters (one
is called ZIP, the other InfoTaskForce) is available on

ftp.gmd.de

directory:

/if-archive/infocom/interpreters/itf/
itf-pl2-src.tar.Z C source code and documentation - patch level 2
itfp2src.zip [same contents]
itf402beta.tar.Z C source code of version 4.02 Beta of the
InfoTaskForce interpreter.

/if-archive/infocom/interpreters/zip/
zip.sh.Z portable source code for Amiga, DOS, Unix and VMS

I think it would be useful. The later Infocom games required 80-columns
and more memory than Atari computers had. Both of these have been fixed.

Just thought I'd make the suggestion.

jlodoen@shell.portal.com

Thanks for the FTP site. I always wanted a working source set for the
infocom interpreter. However, most of the Infocom games were relreased
for the Atari 8-bit back in the early 80's (I have most of them). I am
not sure whether the interpreter is teh same across all games, though.

: Thanks for the FTP site. I always wanted a working source set for the
: infocom interpreter. However, most of the Infocom games were relreased
: for the Atari 8-bit back in the early 80's (I have most of them). I am
: not sure whether the interpreter is teh same across all games, though.

Sure, most were. But starting with "A Mind Forever Voyaging", not every
Infocom game came out for 8-bits.

I bought them for the PC. Each game consists of a *.DAT file and an
executable for it (except Zork 0, it's graphical and in another format).
I use the ZIP interpreter and deleted the executables. Saves room. Now
there is a Windows version. Pretty neat.

For Sale:
130XE 128k Atari 8-bit computer
1050 Disk Drive
XM301 300bps modem
All power supplies and cables

Lots of software, including:
SAM (speech synthesizer)
RemBrandt (powerful paint program)
XE Term TTY Terminal w/ Xmodem
80 Column VT-100 terminal program
SpeedCalc spreadsheet program
StarRaiders II
Antic Music Player, with many song files
4096 Color GIF picture displayer
Basic Compiler
Mule Disk Utility: transfer files to/from IBM
ZPlot 3d equation plotter
tons of games
tons of utilities
tons of basic programs
Screen Plot 1020 plotter program (w/ no 1020)
MapWare (maps any section of planet, any type of map)
DOS 2.5, DOS 2.0, DOS 3.0, DOS 4.0
Atari Artist with Touch Tablet

Best reasonable offer takes everything.
Buyer pays shipping or picks up stuff from Northern Virginia.
It might be a while before I can get everything packed to go as
I am at school and the stuff is at home.

Please email replys to jws4p@virginia.edu

Yes, I think Best has them. But you can homebrew your own. That is what
I did. I think it uses a DB15. You can go from DB15 to a ribbon cable
back to a DB15 into the port. But I think there is a physical limitation
of how long it can be before it starts acting flaky. But in my case the
XEGS started acting flaky probably for other reasons like the MUX jobber
I did (i.e. soldering it in without a socket).

5828. Interface idea

Newsgroup: comp.sys.atari.8bit
Date: 1994-10-19 04:58:35 UTC
From: krishna@max.tiac.net
Message-ID: <38291r$rl@sundog.tiac.net>
Source record: 97698

Here is an idea. I think SIO2PC is a cool idea, but it is still too slow even in USD mode. The MUX displays the ability of the Atari to rerout things through the cart port, and that this port is equally capable as a hard drive data port as the Black Box.

Why not build a MUX network in which the master is a PC?

I suppose the fastest standard port on a PC is the parallel port, right? I'm not sure how much handshaking it supports, though.

Anyway, my dream system would involve a MUX that ends with a PC, ANY PC. The software would be kinda like SIO2PC. But make it so that it requires a multitasking OS like OS/2 because otherwise it ties up that machine a lot. Write the source in portable C so that mac and amiga users can use it (hopefully).

All the ataris are linked via cart ports, like the MUX and a special interface goes from the master cart to the parallel port on the PC.

Each slave would have an independent set of partitions it can access. The networking software would allow changing the individual partitions on the fly. The PC interface would have none of the I/O limitations of an Atari 8-bit. Therefore each I/O request from the Atari's could be specific instructions for particular partitions which the PC would have far more flexibility in fetching. You could have 100 total partitions and each slave has the freedom to bank in and out partitions and call each one its own unique drive number.

It'll never happen, but it would be something.

5841. Just can't get along...

Newsgroup: comp.sys.atari.8bit
Date: 1994-10-19 22:10:00 UTC
From: Dag.Hugdahl@flight.org
Message-ID: <20c_9410200025@flight.org>
Source record: 97818

Ok, I'm having a strange problem. It seems as though my XF551 (upgraded to 3.5 courtesy of CSS) and my P:R:Connection do not get along very well. When the XF is hooked up after the P:R: (with a 1050 inbetween), the P:R: behaves unpredictably. I can be on the modem with Bobterm or Flickerterm and all of sudden, I lose communication with the modem. The programs themselves do not lock up, but I can't do anything. I can also see that no keypresses are being received by the modem. Also, after exiting the programs to DOS (I use SDX), I then usually get Error 140's (serial framing errors) or Error 142's (SIO serial bus overrun error) whenever I try to access the 1050 or XF. Access to the Ramdisk is fine. Both the P:R: and XF work fine by themselves or when I'm not trying to use the modem with the XF plugged in.

Does anyone have any ideas as to what may be wrong or how I can fix them? Do I have a flakey P:R: or XF? I have a 256k 800XL and SDX. The P:R:C is plugged in first, followed by the 1050, and finally the XF551...

Thanks!

5842. The Atari 8-bit Omnibus

Newsgroup: comp.sys.atari.8bit
Date: 1994-10-19 22:36:54 UTC
From: d.paterson2@genie.geis.com
Message-ID: <199410192236.AA272816191@relay2.geis.com>
Source record: 97683

Years ago I looked forward with eager anticipation as each new issue of Antic and Analog hit the newsstands. Page after page of programs and news, but even better were the ads. Dozens of companies with new and exciting hardware and software all clamouring for my attention.

The shrinking 8-bit market has kept most advertisers from any large scale advertising in recent years. Several months ago, I decided to change that. I wrote to all the vendors and developers listed in Michael Current's list, offering them free advertising in The Atari 8-bit Omnibus. And, page by page, the Omnibus filled. Ads came in all shapes and sizes, from professionally laid out full page ads to a torn piece of notepaper with a handwritten scrawl.

And now it's complete. Find out about 'Lemmings' and 'Operation Wolf' clones for the 8-bit. Slave a PC to your 8-bit. Make your original 800 compatible with the XE - even down to memory banking! And many, many more offers, featuring software and hardware, showing that the Atari 8-bit is still a fine machine.

On November 1, 1994, the Omnibus will begin shipping (it's off to the printers right now). This twenty-four page catalog is only $5 US per copy, shipped worldwide. Orders for five or more copies are only $4 US each, when shipped to a single address.

To order, send your cheque or money order payable to David A. Paterson to:

ATTN: Atari 8-bit Omnibus
D.A. Paterson
P.O. Box 342
Cote-St-Luc, QU H4V 2Y5

: : Therefore the future of Page 6 is still looking very unstable.

: I can't understand why... I mean, budget cassettes starting at 50p, and no-one
: is interested. Or are 88% of subscribers actually that skint?
: Incidentally, they have some pretty good games for sale.
: At this moment in time, I could understand if Page 6 felt like packing it all
: in. Do people really want that to happen?

: --

Until I changed to "another format" ago I used to subscribe to Page 6. As
far as I can see it is the reluctance to go down the ST road that has
destroyed them, not poor quality or anything else. I know P6 was dedicated
to the 8-bit, but surely this market is now so small it is hardly worth while.
Likewise due to the fact that you cannot get the mag from newsagents
they are efefctively (though no fault of their own) preventing new readers
comming on board. Its a shame really as it IS the UK's 8-bit institution.

Still the 8-bit has been around for over 10 years, this is quite a good
innings!

Rod

Reluctance to change to the ST? Personally, I see the ST as having no more
relevance to the 8 bit than any other machine. In fact, in terms of design(ers)
the Amiga is much closer to the 8 bit Atari than the ST.
SO what you are saying about Page 6 is that they should give it up, because
there are other, larger markets?
In my view, the ST section seems to be a bit of a token gesture. I'm not about
to criticise the ST (I'm not too fond of them, but that's my opinion), but
what connection is there excpet the name on the box? It was said of Nicholas
Fairbairn MPs constituents once (not by me!) that they would vote for a plank
of wood if it was wearing a Tory rosette... there seems to be a similar
attitude amongst computer users. I used to own an ST, now I own an Amiga,
and I hate both companies. (Tho' with reference to C=, perhaps I shouldn't
speak ill of the dead.... then again, why not!).

Anyway, it's fair to say that if Page 6 had switched their main support to the
ST I wouldn't be buying the magazine. (I recieved a message from someone who
had just taken out a new sub to P6 after 8 years he said! So if they get
enough publicity, they might continue for a while yet..)

And, last but not least.. 10 years? I think it's 15 now, which is a major
difference when you think that not only were the 400 and 800 out a *year* before
the ZX80, but that Star Raiders came out at the same time. What were other
manufacturers doing at that time?

>What does modul mean? cartridge?

Roland had developed a lot of hardware-upgrades using the cartrige-slot (in German " Modulport ").

So he calls his upgrades "Printer-Modul" ; "Clock-Modul" etc.

The upgrades are fine things and as I know a "hercules-grafik-card" is already runnig on the PC-Slot-adaptor.

The last information I have is that they are working on an "E:-device" to get all the originally outputs of standard programms on an 80-Charakter-screen.

I have the following Atari 8-bit items for sale:

* - denotes Game Title
# -denotes Productivity Title
@- denotes Educational Title
^ - Uitility Title
All are disk based, unless noted other wise.

Software without boxes and have docs:

XLent Word Processor (#)
Flight Simulator II (*)
Juggles House (Cassette) (@)
My First Alphabet (@)
Time Wise (#)
Typo Attack (@)
Home Filing Manager (#)
Family Finances (#)
Bridge 4.0 (*)
BookKeeper (#)
BankStreet Writer (#)
Chop Suey (*)
Stock Market (*)
Atari Speed Reading (Cassette) (@)
AtariWriter (Cartridge) (#)

Software without boxes and docs:

PacMan (Cartridge) (*)
PacMan (Cartridge) (*)
Antic Disks (3) All three for $7+S/H
Star Raiders (Cartridge) (*)
CheckMate (#)
Jaw Breaker (*)
World Championship Karate (*)
HomeCard (#)

Software with boxes and docs:

Zork I (*)
Zork II (*)
VisiCalc (#)
Crusade in Europe (*)
Nato Commander (*)
Conflict in Vietnam (*)
Top Gunner Collection (*)

Spy vs. Spy (*)
Decision in the Desert (*)
Peggammon (*)
F-15 Strike Eagle (*)
BallBlazer (*)
Kennedy Approach (*)
Puzzle Panic (*)
Ace of Aces (*)
Reforger (*)
Fight Night (*)
Blue Team Bridge (*)
Archon (*)
Hardball (*)
One on One (*)
Eastern Front (*)
Mickey in the Great Outdoors (Cassette) (#)
Interlisp/65 (^)
Financial CookBook (#)
Combat Leader (*)
Home Filing Manager (#)
AtariWriter (#)

Books:

How to Program the Atari in 6502 Machine Language
Atari Roots
Atari Basic
Compute's First Book of Atari Graphics
Compute's First Book of Atari
Mapping the Atari

Hardware:

1050 Disk Drive w/PS and Cable
800xl w/PS and Cables
800xl no PS and Cables
1027 Printer w/PS and Cable
Supra 300 Baud Modem w/PS,Cable and Software
Koala Pad w/Cable and Software

Parts:

Complete Antic Chip Set
Atari 400 Keypad
26 Assorted IC Chips from various Atari Hardware
items such as xmm-801,xmm-301,810,1050,800xl,1027,850,400/800, all for
$15+
S/H

Please Email me at SERG 21 if your interested in anything and leave a
price
with s/h included and i will get back to ASAP.

I agree. There is absolutely no connection in terms of archetectural
style between the Atari 8-bit and the Atari ST/TT/Falcon series. When
the american 8-bit mags started mutating into ST mags I was saddened
greatly. Now, I did feel in 1985 that the ST was way better than the
first MACs because of their color, but I was also ignorant of the Amiga
because it didn't even get as good distribution that the ST got the first
year it was out. I never saw an Amiga at a department store, but I did
see an ST early on. I was also harboring anti-CBM feelings back then so
I remained ignorant of the Amiga until I first saw an Eric Schwartz
animation about 2 years ago. Then when I saw Babylon5 I realized that
the Amiga was something special and I had to check it out. By this time
I had learned that Jay Miner developed the Amiga so I was intrigued.

Suffice to say, I wound up purchasing an Amiga 1200 and I am very pleased
with it. I have enough memory now to run the Lightwave 3D standalone so
theoretically I could render animations nearly identical to those of
Foundation imaging (I would render to HAM8 probably) and THAT is exciting,
to own a machine which on the surface looks extremely modest, a console
machine, the concept which seems to have disappeared from mainstream
computing but was the standard in the Atari 8-bit era, yet has a very
powerful OS, a custom chip archetecture that has many special features,
and a software library which (at least as far as graphics) is totally
state of the art. It is very easy for me to see this machine as an
extention of at least the ideas of the Atari 8-bit. Even having a PC
running SIO2PC or Darek's emulator would be a disappointment compared to
the sense of continuity I experience. And yes, I am concerned about the
fate of CBM, but at this time the things I can do in this platform are
already overwhelming, things which I was waiting for naught while
exclusively in the Atari 8-bit domain, fax software, Jpeg viewing,
Postcript/WYSIWYG DTP capability, TCP software, newer and more expansive
WP and DB apps, color ANSI emulation, time-saving multitasking features,
and so on.

A company by the name of Magma Systems was supposedly doing some very
similar work with the cart port. You see, it seems as though the cart
port is nearly as capable as the PBI if you know how to program for it!
For instance, with the Multiplexer from CSS it serves as a hard drive
port about 90% as fast as a direct PBI connection.

I'd be interested in seeing what this guy comes up with. Magma seemed to
die off out of a sad lack of publicity and openness by its owner, who
went by the name of Magnussen. I think if this european developer makes
his products available in a convenient manner to the worldwide 8-bit
userbase, especially the USA, that he will do well enough to keep going.

When you say PC-Slot adapter, do you mean a cart interface that ends with
an ISA slot? That would be very interesting indeed.

Best had prototypes only. They were never mass-produced, hence the $CALL
pricing. They don't have any NOW. The old catalogue is showing its age ;)

Tower Toppler and Xenophobe exist for the 7800 and I know 1st hand that
TT is very very nice on the 7800. Some of it is Genesis-quality graphics.

By the way, Clay Halliwell wrote an updated Executive for Computereyes.
It is much nicer now. Still could use a little work to aid in creating
.RGBs, but it is still way nicer than the original crud program.

Yep, there's an 8-bit ISA slot on the adapter. Most of the original ISA
signals are supported (but not all). I've got the interface but couldn't test
the Hercules-Card yet, because I don't own a TLL Hercules monitor.

5863. MASSIVE AUCTION IV -- update #2 (includes 8-bit and other Atari)

Newsgroup: comp.sys.atari.8bit
Date: 1994-10-21 13:47:59 UTC
From: dw901@cleveland.Freenet.Edu
Message-ID: <388gqf$nog@usenet.INS.CWRU.Edu>
Source record: 97779

MASSIVE AUCTION IV -- UPDATE #2:

NOTE: EVERY ITEM RECEIVING AT LEAST THE MINIMUM BID WILL BE SOLD!

I finally had a chance to sort through ALL of my stuff, and so this is a rather large file. If you don't like large files, and/or auctions, please stop reading now. You have been warned!

I will post updates approximately every 36 hours, and delete the last update after I'm sure the new one is up. I will also e-mail the list to all bidders, and anyone who request's it.

Mike

PLEASE READ THE AUCTION RULES AT LEAST ONCE BEFORE PLACING BIDS.

NOTE: I will use the first part of your E-mail address when listing bids.

****

Games and/or game systems included in this auction are:

ATARI 2600 ATARI 5200 ATARI 7800 ATARI LYNX
ATARI 8-bit games ATARI computers COLECOVISION COMMODORE 64
INTELLIVISION ODYSSEY2 PONG (VARIOUS) TOMY TUTOR
SEGA MASTER SYSTEM TEXAS INSTRUMENTS TRS-80 COLOR COMPUTER VECTREX

AUCTION RULES:
1) THE DEADLINE FOR BIDDING IS 11:59 P.M. EST, ON WEDNESDAY, OCTOBER 26TH.

2) MINIMUM BIDS ARE LISTED FOR EACH ITEM UP FOR AUCTION, MINIMUM INCREMENTS ARE $0.50 ON GAMES AND $1.00 ON SYSTEMS.

3) BUYER PAYS ALL SHIPPING COSTS.

4) NO PACKAGE DEALS ON GAMES OR SYSTEMS.

5) TRADE OFFERS WILL BE ENTERTAINED, BUT CASH OFFERS ARE GIVEN PRIORITY (UNLESS THE TRADE OFFER INCLUDES VECTREX GAMES OR SYSTEMS!).

6) EVERYTHING IS SOLD AS IS. UNLESS SPECIFIED, ALL GAMES AND SYSTEMS HAVE BEEN TESTED AND ARE IN WORKING ORDER.

7) IN CASE OF TIES, FIRST BID RECEIVED WINS.

8) IF YOU ARE THE HIGH BIDDER ON AN ITEM, YOU ARE EXPECTED TO BUY THAT ITEM. DON'T PLACE A BID UNLESS YOU ARE PREPARED TO BUY WHAT YOU BID ON.

9) IF YOU DON'T FOLLOW THROUGH ON A BID, YOU WON'T BE ABLE TO PARTICIPATE IN FUTURE AUCTIONS.

10) PAYMENT MUST BE MADE IN U.S. FUNDS, DRAWN FROM A U.S. BANK BRANCH.

NOTE: ALL CARTRIDGES ARE LOOSE (IE. WITHOUT BOX AND MANUAL), UNLESS SPECIFIED.

****

HARDWARE:

NOTE FOR THOSE BIDDING ON SYSTEMS: If you are the high bidder on certain
systems (they are marked) you will have the option of buying a brand new RF
switchbox for $5 that is virtually identical to one sold at Radio Shack for $7.
It allows for the connection of both 300 OHM and 75 OHM antenna lead-in's.

If you already have an RF switchbox, most systems will work fine with it. Some
systems still include one, please read carefully. I just ran out of used RF
switchbox's in the last MASSIVE AUCTION, sorry.

LOT #1 - THERE ARE 3 OF THESE SYSTEMS AVAILABLE, THE TOP 3 BIDS ARE LISTED.

NEW RF SWITCHBOX PURCHASE OPTION

ATARI 2600 SYSTEM (4-SWITCH DESIGN), WITH TWO (2) ATARI JOYSTICKS, ONE SET OF
TWO PADDLE CONTROLLERS, POWER SUPPLY, AND SIX (6) GAMES [NO BOXES, OR MANUALS

FOR GAMES]:

ASTEROIDS (Atari)
BREAKOUT (Atari)
COMBAT (Atari)
HOME RUN (Atari)
SPACE INVADERS (Atari)
SWORDQUEST: EARTHWORLD (Atari)

THESE ARE COMPLETE ATARI 2600 SYSTEMS, EXCEPT FOR RF SWITCHBOX.

BID #1) MINIMUM OPENING BID OF $25.00
BID #2) MINIMUM OPENING BID OF $25.00
BID #3) MINIMUM OPENING BID OF $25.00

*****

LOT #2 - THERE ARE 3 OF THESE SYSTEMS AVAILABLE, THE TOP 3 BIDS ARE LISTED.

NEW RF SWITCHBOX PURCHASE OPTION

ATARI 2600 SYSTEM (4-SWITCH DESIGN), WITH TWO (2) ATARI JOYSTICKS, POWER SUPPLY, AND SIX (6) GAMES [NO BOXES, OR MANUALS FOR GAMES, EXCEPT ASTEROIDS HAS MANUAL]:

ASTEROIDS (Atari) [WITH ORIGINAL MANUAL]
COMBAT (Atari)
DONKEY KONG (Coleco)
MISSILE COMMAND (Atari)
PAC-MAN (Atari)
SPACE INVADERS (Atari)

THESE ARE COMPLETE ATARI 2600 SYSTEMS, EXCEPT FOR RF SWITCHBOX.

BID #1) MINIMUM OPENING BID OF $25.00
BID #2) MINIMUM OPENING BID OF $25.00
BID #3) MINIMUM OPENING BID OF $25.00

*****

LOT #3

NEW RF SWITCHBOX PURCHASE OPTION

SEARS TELE-GAMES (ATARI 2600 COMPATIBLE SYSTEM) WITH BOX, MANUAL, TWO (2) ATARI JOYSTICKS, ONE SET OF TWO PADDLE CONTROLLERS, POWER SUPPLY, AND TEN (10) TELE-GAMES CARTRIDGES [NO BOXES, OR MANUALS FOR GAMES]:

BOWLING (Tele-Games)
BREAKAWAY IV (Tele-Games)
FOOTBALL (Tele-Games)
GOLF (Tele-Games)
MISSILE COMMAND (Tele-Games)
PAC-MAN (Tele-Games)
PONG SPORTS (Tele-Games)

SPACE INVADERS (Tele-Games)
TANK-PLUS (Tele-Games)
TARGET FUN (Tele-Games)

THIS IS A COMPLETE ATARI 2600 COMPATIBLE SYSTEM, EXCEPT FOR RF SWITCHBOX.

THE BOX AND MANUAL AREN'T IN GOOD SHAPE, BUT BOTH ARE INTACT.

MINIMUM OPENING BID OF $60.00

*****

LOT #4

NEW RF SWITCHBOX PURCHASE OPTION

ATARI 5200 (2-PORT), ONE ATARI CONTROLLER, ATARI POWER SUPPLY, AND ONE (1) GAME [NO BOX OR MANUAL FOR GAME]:

PAC-MAN

THE CONTROLLER IS WORKING, AT THIS TIME, BUT THE FIRE BUTTON CONTACTS ON THE INSIDE NEED CLEANING PERIODICALLY. I WILL ALSO THROW IN A NON-WORKING CONTROLLER FOR PARTS, FREE.

$30.00 RichCZeta

*****

I want it! Then I could use the cheaper 'internal' modems with my
Atari.

I wonder how hard it would be to hack up one of those interfaces
anyway. I haven't been able to find much info about ISA tech specs.

5865. VT 100 Emu. ?

Newsgroup: comp.sys.atari.8bit
Date: 1994-10-21 16:31:41 UTC
From: gbya@access3.digex.net
Message-ID: <388qdd$j8e@news1.digex.net>
Source record: 97773

After downloading numerous terminal programs, including FlickerTerm, I have just about given up hope of achieving VT-100 emulation on my 8-bit. I have a 130XE and use the XM301 modem snailing along at 300bps. Can I emulate VT-100 without additional hardware (e.g. 850 interface or Hayes comp. modem)? I would really appreciate any assistance.

What was the problem using FlickerTerm 80 with your XM301? Most all of the
term programs work with any modem, whether 835/1030/XM301, SX212, or
connected through an RS232 interface. It should only be a matter of
running the right R: software handler. I don't know why VT100 emulation
should be a problem at 300bps.

He probably didn't get the handler from Bobterm to use with Flickerterm.

Bobterm has the XM301 handler in the .arc file.

Source record: 97807

We have a large batch of old issues of the British Atari mags
Page 6 and Atari User. We have more Page 6 than AU at the moment,
and all the mags are on our used hardware/software list thatgets
sent to customers in the UK.

However, we have several copies of many issues and so there should
be plenty available if anybody wants some. We charge just $1 each
plus shipping (best by surface-
it's cheaper!). E-mail me
if you want a few.

Dean

5873. Remote control joystick problems

Newsgroup: comp.sys.atari.8bit
Date: 1994-10-23 01:08:20 UTC
From: PlaceYourUserIdHere@postbox.acs.ohio-state.edu
Message-ID: <PlaceYourUserIdHere.1.2EA9B784@postbox.acs.ohio-state.edu>
Source record: 97810

Hello, I have recently purchased a very used Atari 800 with a set of remote control joysticks. I am having a problem getting these puppies to work. The receiver has a stereo-like jack for the power supply (it was made for use with the 2600 game system). Anyway, I bought a 9V power supply from radio shack and plugged all the stuff in and...nada. Does anyone have ANY idea if this is possible? I lost contact with the guy I bought em off of, and no manuals were included with the purchase. I duwanna try a higher voltage, for fear of a meltdown..:(I am assuming that the power requirements for the receiver is the same as for a 2600...if anyone has experience with these thangs, pleeeeze help! They look sooo coool! Thanx in advance...

5874. Using a 1.44 meg with CSS xf upgrade

RlLast night was the CACUG meeting. One of the members has a CSS xf
Rlupgrade and is using a 1.44 meg floppy mechanism. He can't get it
Rlto read/write beyond sector 1440, it errar 139s. Is this because
Rlhe is using a 1.44 meg mech. or because there is something wrong
Rlwith either the mech. or his installation?

Neither. The xf upgrade is not capiable of using 1.44 meg, Only 720k is
possiable. The 1.44 meg mech will work fine at 720k. The only differance
between 720k and 1.44 meg is the number of sectors per track. To achive
this, the clock speed on the floppy drive controller is doubled thus
doubling the data stored on each track. that is why 1.44 is two times .720.
doubling the clock speed in the xf is more trouble then it is worth.

Help. I have an ATR8000 with no docs or disks. Could some one help me with either or both. Some circuit diagrames will also be very helpfull. I cannot get it to work altho the processor seems to be working fine. Any information on the 8430 Z80 CTC will help as well. What should happen when powered up with a printer and a floppy drive connected???????

Thanks in advance.

5878. call back service ???

Newsgroup: comp.sys.atari.8bit
Date: 1994-10-23 21:58:48 UTC
From: didi@didi.mayn.sub.de
Message-ID: <didi.01pd@didi.mayn.sub.de>
Source record: 97609

Hello,
Is there somebody able to give me some informations
about the call back service ?
How much are the prices for this and how can I acces this service ?
Maybe the Abbuc can save money with this servis for his
net-calls to the U.S.A.
Any informations welcome.

5880. 850 w/Modem Question

Newsgroup: comp.sys.atari.8bit
Date: 1994-10-23 23:15:32 UTC
From: Joe Walsh <ransom22@delphi.com>
Message-ID: <RK80aBU.ransom22@delphi.com>
Source record: 97816

While I am a long-time user of Atari 8-bit products, I have never used
a non-Atari modem with the 8-bit computer. I've used the SX-212 with the
850 interface, however.

This time, I connected my Practical Peripherals 14400FXMT II modem to the
850 using the standard Atari modem cable. The modem is set to factory
defaults in all registers.
I'm using BobTerm.
When I tell BobTerm to dial, everything seems to work fine. It dials the
number, I hear the ringing, it picks up, I hear the handshake, and then
BobTerm buzzes to say it is connected.
Finally, the terminal screen pops up. So far so good.
However, at this point no matter what I type, nothing comes through.
The remote system does not get anything printed on my screen either.
The modem says that it is still connected.
ATH does not hang up the phone. Hitting START and telling BobTerm to hang
up doesn't work either.

If you have a solution to this situation, please get in touch with me,
either here or in email to ransom22@delphi.com

Thank you,

Joe

5881. Re: Using a 1.44 meg with CSS xf upgrade

Newsgroup: comp.sys.atari.8bit
Date: 1994-10-24 00:13:28 UTC
From: cmwagner@gate.net
Message-ID: <38eu78$14cd@tequesta.gate.net>
Source record: 97850

I am wondering if it is possible to hook up a 1.44 meg floppy drive to an Atari, what would be involved in the interface and would this interface be able to handle all floppy drives from 180K to 2.88M (I imagine so if it were designed that way). It seems like it could be an interesting project and it is about time that Atari had some high density drives. I imagine this interface could be configured through dip switches what size drive would be installed and it could be configured for which device and everything. So has anyone thought about this project?

5882. Re: C64.??

Per.Erik Peterson (per.erik.peterson@straight.ct.se) wrote:
: I informed a friend to me who have an old C=64 about SIO2PC and Black Box and
: other stuff there is for Atari 8. And he wonder if anyone knows if there is
: some simulair stuff for Commondore?? C642PC or something like that?

There is one for the Commodore, it is called 64NET, there is a discussion
probably going on in comp.sys.cbm, but 64NET is apparently what would be the
most similiar package.

5883. MASSIVE AUCTION IV -- update #3 (includes Atari 8-bit)

Newsgroup: comp.sys.atari.8bit
Date: 1994-10-24 00:19:00 UTC

MASSIVE AUCTION IV -- UPDATE #3:

Due to problems with my local system, I have been unable to e-mail/post updates
or receieve e-mail for the last 2 days. To compensate for this, I am
extending the deadline for the auction by 2 days, until Friday at 11:59 p.m.

****

This is a rather large file, if you don't like large files, and/or auctions,
please stop reading now. You have been warned!

I will post updates approximately every 24 hours, and delete the last update
after I'm sure the new one is up. I will also e-mail the list to all bidders,
and anyone who request's it.

Mike

Games and/or game systems included in this auction are:

ATARI 2600 ATARI 5200 ATARI 7800 ATARI LYNX
ATARI 8-bit games ATARI computers COLECOVISION COMMODORE 64
INTELLIVISION ODYSSEY2 PONG (VARIOUS) TOMY TUTOR
SEGA MASTER SYSTEM TEXAS INSTRUMENTS TRS-80 COLOR COMPUTER VECTREX

****

PLEASE READ THE AUCTION RULES AT LEAST ONCE BEFORE PLACING BIDS.

NOTE: I will use the first part of your E-mail address when listing bids.

****

AUCTION RULES:
1) THE DEADLINE FOR BIDDING IS 11:59 P.M. EST, ON FRIDAY, OCTOBER 28TH.

2) MINIMUM BIDS ARE LISTED FOR EACH ITEM UP FOR AUCTION, MINIMUM INCREMENTS
ARE $0.50 ON GAMES AND $1.00 ON SYSTEMS.

3) BUYER PAYS ALL SHIPPING COSTS.

4) NO PACKAGE DEALS ON GAMES OR SYSTEMS.

5) TRADE OFFERS WILL BE ENTERTAINED, BUT CASH OFFERS ARE GIVEN PRIORITY
(UNLESS THE TRADE OFFER INCLUDES VECTREX GAMES OR SYSTEMS!).

6) EVERYTHING IS SOLD AS IS. UNLESS SPECIFIED, ALL GAMES AND SYSTEMS HAVE
BEEN TESTED AND ARE IN WORKING ORDER.

7) IN CASE OF TIES, FIRST BID RECEIVED WINS.

8) IF YOU ARE THE HIGH BIDDER ON AN ITEM, YOU ARE EXPECTED TO BUY THAT
ITEM. DON'T PLACE A BID UNLESS YOU ARE PREPARED TO BUY WHAT YOU BID ON.

9) IF YOU DON'T FOLLOW THROUGH ON A BID, YOU WON'T BE ABLE TO PARTICIPATE
IN FUTURE AUCTIONS.

10) PAYMENT MUST BE MADE IN U.S. FUNDS, DRAWN FROM A U.S. BANK BRANCH.

NOTE: ALL CARTRIDGES ARE LOOSE (IE. WITHOUT BOX AND MANUAL), UNLESS SPECIFIED.

HARDWARE:

NOTE FOR THOSE BIDDING ON SYSTEMS: If you are the high bidder on certain
systems (they are marked) you will have the option of buying a brand new RF
switchbox for $5 that is virtually identical to one sold at Radio Shack for $7.
It allows for the connection of both 300 OHM and 75 OHM antenna lead-in's.

If you already have an RF switchbox, most systems will work fine with it. Some
systems still include one, please read carefully. I just ran out of used RF
switchbox's in the last MASSIVE AUCTION, sorry.

LOT #1 - THERE ARE 3 OF THESE SYSTEMS AVAILABLE, THE TOP 3 BIDS ARE LISTED.

NEW RF SWITCHBOX PURCHASE OPTION

ATARI 2600 SYSTEM (4-SWITCH DESIGN), WITH TWO (2) ATARI JOYSTICKS, ONE SET OF TWO PADDLE CONTROLLERS, POWER SUPPLY, AND SIX (6) GAMES [NO BOXES, OR MANUALS FOR GAMES]:

ASTEROIDS (Atari)
BREAKOUT (Atari)
COMBAT (Atari)
HOME RUN (Atari)
SPACE INVADERS (Atari)
SWORDQUEST: EARTHWORLD (Atari)

THESE ARE COMPLETE ATARI 2600 SYSTEMS, EXCEPT FOR RF SWITCHBOX.

BID #1) MINIMUM OPENING BID OF $25.00
BID #2) MINIMUM OPENING BID OF $25.00
BID #3) MINIMUM OPENING BID OF $25.00

*****

LOT #2 - THERE ARE 3 OF THESE SYSTEMS AVAILABLE, THE TOP 3 BIDS ARE LISTED.

NEW RF SWITCHBOX PURCHASE OPTION

ATARI 2600 SYSTEM (4-SWITCH DESIGN), WITH TWO (2) ATARI JOYSTICKS, POWER SUPPLY, AND SIX (6) GAMES [NO BOXES, OR MANUALS FOR GAMES, EXCEPT ASTEROIDS HAS MANUAL]:

ASTEROIDS (Atari) [WITH ORIGINAL MANUAL]
COMBAT (Atari)
DONKEY KONG (Coleco)
MISSILE COMMAND (Atari)
PAC-MAN (Atari)
SPACE INVADERS (Atari)

THESE ARE COMPLETE ATARI 2600 SYSTEMS, EXCEPT FOR RF SWITCHBOX.

BID #1) MINIMUM OPENING BID OF $25.00
BID #2) MINIMUM OPENING BID OF $25.00
BID #3) MINIMUM OPENING BID OF $25.00

*****

LOT #3

NEW RF SWITCHBOX PURCHASE OPTION

SEARS TELE-GAMES (ATARI 2600 COMPATIBLE SYSTEM) WITH BOX, MANUAL, TWO (2) ATARI JOYSTICKS, ONE SET OF TWO PADDLE CONTROLLERS, POWER SUPPLY, AND TEN (10) TELE-GAMES CARTRIDGES [NO BOXES, OR MANUALS FOR GAMES]:

BOWLING (Tele-Games)

ATARI 5200 (4-PORT), ONE ATARI CONTROLLER, AND ONE (1) GAME [NO BOX FOR GAME]:

PAC-MAN (WITH MANUAL)

THE CONTROLLER IS WORKING, AT THIS TIME, BUT THE FIRE BUTTON CONTACTS ON THE INSIDE NEED CLEANING PERIODICALLY. I WILL ALSO THROW IN A NON-WORKING CONTROLLER FOR PARTS, FREE.

THERE IS NO RF/POWER SWITCHBOX WITH THIS SYSTEM, BUT I WILL INCLUDE PLANS ON HOW TO BUILD ONE. THE PARTS COST APPROX. $8 AT RADIO SHACK.

THIS SYSTEM DOESN'T COME WITH A POWER SUPPLY. THE SPECIFICATIONS ARE:

INPUT: 120V AC 60HZ 33W
OUTPUT: 11.5V DC 1.95AMP

$25.00 jcarr

*****

LOT #7

NEW RF SWITCHBOX PURCHASE OPTION

ATARI 400 COMPUTER WITH ONE ATARI JOYSTICK, AND CENTIPEDE CARTRIDGE.

THIS SYSTEM DOES NOT COME WITH A POWER SUPPLY. THE SPECIFICATIONS FOR THE POWER SUPPLY ARE AS FOLLOWS:

MODEL NO. -- CO 14319 (Atari)
INPUT: 120 VAC, 60 HZ, 18.5 W
OUTPUT: 9 VAC, 15.3 VA

$15.00 gt2378b

*****

LOT #8

NEW RF SWITCHBOX PURCHASE OPTION

ATARI 800 COMPUTER WITH ONE ATARI JOYSTICK, POWER SUPPLY, AND PAC-MAN CARTRIDGE.

MINIMUM OPENING BID OF $30.00

*****

LOT #9

NEW RF SWITCHBOX PURCHASE OPTION

ATARI 1200XL COMPUTER WITH ONE ATARI JOYSTICK, POWER SUPPLY, AND PAC-MAN CARTRIDGE.

MINIMUM OPENING BID OF $40.00

*****

LOT #10 - THERE ARE 2 OF THESE SYSTEMS AVAILABLE, THE TOP 2 BIDS ARE LISTED.

COLECOVISION SYSTEM WITH COLECO POWER SUPPLY, RF SWITCHBOX, TWO (2) CONTROLLERS, AND DONKEY KONG CARTRIDGE.

BID #1) $38.00 rdavis
BID #2) MINIMUM OPENING BID OF $35.00

*****

LOT #11

COLECOVISION EXPANSION MODULE NO. 1: ATARI 2600 CONVERTER. PLAY VIRTUALLY ALL ATARI 2600 GAMES ON YOUR COLECOVISION SYSTEM.

MINIMUM OPENING BID OF $20.00

*****

LOT #12

NEW RF SWITCHBOX PURCHASE OPTION

COMMODORE 64 COMPUTER SYSTEM WITH BOX, USER'S MANUAL (200 pgs.), POWER SUPPLY, AND BOTH KICKMAN AND MUSIC COMPOSER CARTRIDGES.

MINIMUM OPENING BID OF $40.00

*****

LOT #13

COMMODORE 1541 DISK DRIVE (PUSH IN MODEL, FOR USE WITH C64 COMPUTER SYSTEM), WITH POWER CORD, SERIAL CABLE, AND 10 DS DISKETTES (WHICH MAY OR MAY NOT HAVE GAMES ON THEM -- DEPENDING ON WHO IS ASKING, IF YOU KNOW WHAT I MEAN).

$30.00 mtmr

*****

LOT #14

NEW RF SWITCHBOX PURCHASE OPTION

MATTEL INTELLIVISION SYSTEM WITH TWO (2) CONTROLLERS. SYSTEM ALSO COMES WITH FOUR (4) GAMES [WITH ACCESSORIES LISTED BELOW]:

ARMOR BATTLE (WITH BOX AND 1 OVERLAY)
ASTROSMASH (WITH BOX AND 1 OVERLAY)
LOCK 'N' CHASE (WITH BOX AND 2 OVERLAYS)
SPACE ARMADA (WITH BOX AND 1 OVERLAY)

MINIMUM OPENING BID OF $30.00

*****

LOT #15

NEW RF SWITCHBOX PURCHASE OPTION

SYLVANIA/GTE INTELLIVISION SYSTEM WITH TWO (2) CONTROLLERS. SYSTEM ALSO COMES WITH FOUR (4) GAMES [WITH ACCESSORIES LISTED BELOW]:

ASTROSMASH (WITH BOX AND 1 OVERLAY)
LAS VEGAS POKER & BLACKJACK (WITH BOX AND 2 OVERLAYS)
NIGHT STALKER (WITH BOX AND 1 OVERLAY)
SPACE ARMADA (WITH BOX AND 1 OVERLAY)

MINIMUM OPENING BID OF $30.00

*****

LOT #16 - THERE ARE 2 OF THESE SYSTEMS AVAILABLE, THE TOP 2 BIDS ARE LISTED.

NEW RF SWITCHBOX PURCHASE OPTION

INTELLIVISION II SYSTEM WITH TWO (2) CONTROLLERS, AND POWER SUPPLY. SYSTEM ALSO COMES WITH FOUR (4) COMPLETE GAMES:

LAS VEGAS POKER & BLACKJACK (WITH BOX, MANUAL, AND 2 OVERLAYS)
LOCK 'N' CHASE (WITH BOX, MANUAL, AND 2 OVERLAYS)
NFL FOOTBALL (WITH BOX, MANUAL, PLAYBOOK, AND 2 OVERLAYS)
NIGHT STALKER (WITH BOX, MANUAL, AND 2 OVERLAYS)

BID #1) MINIMUM OPENING BID OF $45.00
BID #2) MINIMUM OPENING BID OF $45.00

*****

LOT #17 - THERE ARE 3 OF THESE SYSTEMS AVAILABLE, THE TOP 3 BIDS ARE LISTED.

NEW RF SWITCHBOX PURCHASE OPTION

ODYSSEY2 SYSTEM WITH POWER SUPPLY (TWO WITH ORIGINAL POWER SUPPLY, AND ONE WITH A *NEW* POWER SUPPLY), AND ONE CARTRIDGE [NO BOX OR MANUAL FOR GAME]:

AJ 9400 - SPEEDWAY! / SPIN-OUT! / CRYPTO-LOGIC!

THE SYSTEM WITH THE *NEW* POWER SUPPLY IS MISSING THE LITTLE BLACK KNOB OFF THE TOP OF BOTH JOYSTICK CONTROLLERS, OTHERWISE EVERYTHING WORKS. THIS SYSTEM WILL BE THE ONE WITH THE LOWEST BID (OR LAST BID RECEIVED, IN CASE OF A TIE).

BID #1) MINIMUM OPENING BID OF $20.00
BID #2) MINIMUM OPENING BID OF $20.00
BID #3) MINIMUM OPENING BID OF $20.00

*****

LOT #18 - THERE ARE 2 OF THESE SYSTEMS AVAILABLE, THE TOP 2 BIDS ARE LISTED.

NEW RF SWITCHBOX PURCHASE OPTION

BENTLEY COMPUVISION PONG SYSTEM, WITH 2 BUILT IN CONTROLLERS, AND FOUR GAMES (PRACTICE, SOCCER, SQUASH, AND TENNIS). NO POWER SOURCE INCLUDED.

THIS SYSTEM CAN EITHER RUN OFF OF BATTERIES, OR USE A 6V DC POWER SUPPLY.

BID #1) MINIMUM OPENING BID OF $7.50
BID #2) MINIMUM OPENING BID OF $7.50

*****

LOT #19

NEW RF SWITCHBOX PURCHASE OPTION

HANIMEX ELECTRONIC TV GAME PONG SYSTEM, WITH 2 BUILT IN CONTROLLERS, AND FOUR GAMES (PRACTICE, HOCKEY, SQUASH, AND TENNIS). NO POWER SOURCE INCLUDED.

THIS SYSTEM CAN EITHER RUN OFF OF BATTERIES, OR USE A 9V DC POWER SUPPLY.

MINIMUM OPENING BID OF $7.50

*****

LOT #20

NEW RF SWITCHBOX PURCHASE OPTION

SEARS TELE-GAMES PONG SPORTS IV (MADE BY ATARI CORP.), WITH 4 PLUG-IN PADDLE CONTROLLERS, AND 16 BUILT IN GAMES (FOUR VARIATIONS EACH OF PONG, HOCKEY, STREET TENNIS, AND STREET HOCKEY). NO POWER SOURCE INCLUDED.

THIS SYSTEM CAN EITHER RUN OFF OF BATTERIES, OR USE A 6V DC POWER SUPPLY.

MINIMUM OPENING BID OF $10.00

*****

LOT #21

NEW RF SWITCHBOX PURCHASE OPTION

RADIO SHACK TRS-80 COLOR COMPUTER, WITH BUILT IN BASIC LANGUAGE, AND POWER SUPPLY.

You could ask in comp.sys.cbm, but most c64 users probably haven't heard
of the SIO2PC and Black Box, so you'd have to describe them.

There are already a couple of ways to use a high density drive on the
atari 8bit.

1) ATR8000 using its floppy port w/1.44 floppy
2) BlackBox Floppy board
3) Percomm disk drive with 1.44 in place of standard 180k mech.

From: sjg@phlem.ph.kcl.ac.uk
Message-ID: <1994Oct24.182316.4884@bay.cc.kcl.ac.uk>
Source record: 97784

Ok, I've rediscovered my 8bit, sitting in the attic, and I've got
hold of my Cousin's old 1050. (c/w happy/US doubler)

1) I see in a.a.u.e there are several files ending in .xmo - what are
these ?

2) It'd be nice to hang a high density disk drive (even a floppy) of
the 800XL. Is there such a thing available ?

I've looked in the FAQ's, but I can't find any answers to the above.

Thanks in advance,

Simon.

the>stereo track to work; where you could recorde stereo audio (music) then
save a>data file, adn if you turned off the data sound, when loading it would
play the>music. Did anyone get this to work (and how), or was this just some
myth?No myth, it can be done, I've seen (or should that be heard?) it done,
I'venever done it myself tho'. As far as I know the trick was to record the
codefirst and then record the audio afterwards on just ONE track - of course
youneed a stereo recorder capable of this - what I can't remember is which is
the audio and which the data track.
--
*** Raphael Espino, rje@cs.nott.ac.uk ***

I can remember which channel it was either but I don't think it can
be stereo. It would be mixed down to one track which would make it mono
on the program recorder. I'm sure there were some USR routines published
to handle this from BASIC which would allow playing of music while the
program and/or data was being loaded. Basically, I believe the register
(cant recall it now) which made program loading audible was disabled (the
other track) and the audio track was enabled. The easiest way to do this
from BASIC is record areas of nothing but audio and then have the program
poke PACTL (54018/D302h) with a 52 to turn on the recorder and a 60 to
turn it off. A lot of the early Atari cassette packages worked on this
principle like the language programs and such. (I remember playing Caverns
of Mars and PACTL would be left on and I'd pop in a tape of Steve Miller's
"Fly like an Eagle" - ah, the good ole days :(~~~~)

>these ?

These are standard files... the old .XMO extension was used on CIS
and BBS's years ago to designate that th efile could be transferred
with Xmodem. Lame, huh? That was before compression programs like
ARC came along. You can rename them to whatever they should be, e.g.
.COM or .EXE.

>2) It'd be nice to hang a high density disk drive (even a floppy) of
>the 800XL. Is there such a thing available ?

No high density drives, but you can get the XF551 disk drive, wich is
a 360K double-sided//double-density drive. Anothyer option is to get
an MIO and hook up a hard drive. The FTe guys just announced the MIO II
which plugs into the parallel bus and lets you use IDE drives, instead
of MFM/RLL drives with an Adaptec controller on the old MIO.

>I've looked in the FAQ's, but I can't find any answers to the above.

5894. Movie with Atari stuff

Newsgroup: comp.sys.atari.8bit
Date: 1994-10-24 23:32:12 UTC
From: jeking@xmission.com
Message-ID: <38hg5s$oki@xmission.xmission.com>
Source record: 97848

Saw a hacker type movie today entitled "PrimeRisk" that shows a hacker type girl using an 800 to break into ATM machines. It also shows her using an 810 disk drive as a remote data terminal! [Grin]

Anybody else see this flick?

--James King
jeking@xmission.com

5895. Wanted: RS-232 (P:R: Connection, MIO, Black Box, ...)

Newsgroup: comp.sys.atari.8bit
Date: 1994-10-25 00:15:46 UTC
From: sourada@iastate.edu
Message-ID: <sourada.783044146@eng1.iastate.edu>
Source record: 97795

I have an 8bit system that I want to use as a terminal, but I don't have RS-232 for it, and don't want to give up my P:R: Connection for my primary 8bit system. I was originally thinking about getting another P:R: Connection, but now that I think about it, I could get an MIO or BlackBox (those both have RS-232, right?) and put the P:R: on the terminal system.

So, does anyone want to get rid of one of the above for a fairly cheap price?

Later,
Steven

Anybody see that film..where this guy has an 800xl (without the top)
who is dying of some deadly disease? He keeps trying to teach the
computer the difference between "broken" "malfunctioning" "dead"..etc..
in a vain attempt to have the computer "fix" him. well..the ending
was rather morbid after he the computer learns its last lesson from
a set of drills.

anyways...

I think the ATR and Percom will do 1 megabyte via an 8" drive.

I heard you might be able to fool a 1.44 into 8" style encoding.

>
>I'd be interested to hear whether this helps.

Thank you for the reply

Leave it to my fellow UseNET users to
determine the solution to any problem.
:)

As you can see from the 40-column
spacing of this message, I have
succeeded in getting the PM144MT II
to work with the 850.

I received two E-Mail replies in
addition to the above-quoted message.
All suggested the same thing. Indeed,
the flow control needed to be turned
off. I used &K0 to turn that off,
&Q0 to turn off the error controls
(the modem manual says they require
flow control, so . . .).

BTW, for anyone else planning on
doing what I've done, also use the
command &C1, so that the darned
carrier detect light will go off
after the call is completed. For
some reason, this modem leaves it
on (factory default is force CD on
at all times).

I want to thank each of you for
helping me with this, in addition
to David Tipton, who also came up
with the solution.

-Joe Walsh

I always have to disagree with this when people bring it up. the Atari 8 bit was FAR superior to the C64 in every aspect except sound - the SID kicked some serious ass, and still sounds better than the AdLib that most PCs are stuck with. (What WERE Roland thinking of?) (And the C64 DID kill the Atari as far as sales went, although now the Atari 8bit is being expanded into some killer machines - some crazy people have a couple of megs of RAM, SCSI adapters, networking, and all sorts of stuff hooked up to them! Even NASA still used them as recently as four years ago. :)

All IMHO, of course! :)

In a message dated 10-23-94, someone at postbox.acs.ohio-state edu said:

"Hello, I have recently purchased a very used Atari 800
with a set of remote control joysticks. I am having a
problem getting these puppies to work. The receiver has
a stereo-like jack for the power supply..."

The power supply that was packaged with my Atari Remote Control Joysticks
is a 9 volt DC output unit, rated at 500ma, with +9 volts on the
center (or 'tip'), and ground on the outside (or 'barrell').

Once the cables from the reciever are plugged into the 800, the
power supply into the reciever, a good 9 volt battery into each
joystick, and the "on/off" switch on each joystick set to "on", you
should be ready to take control.

In 'The Terminator' you see some shots from the Terminators point of view
with one or two columns of green letters on the screen. Those are 6502
assembly! And it's obviously atari 8-bit code because the remarks babble
about the VTOC and stuff. There's an article on one of the first Mega
Magazines containing the sources. :-)

WM> they might be pictures. (?)

In the recesses of my memory, I seem to remember ".XMO" as being a "download extender" for the download section of one of the very early ATARI BBSes such as A.M.I.S. BBS. I seem to recall that ".XMO" implies that the file has been transfered with an early version of XMODEM and has therefore had CONTROL-Z pad characters appended onto the end of the file. To retrieve a working file again, the CONTROL-Z trailer padding needs to be stripped off. A copy of the file is made, and then a utility such as Disk Doctor (the original program, not the SpartaDOS utility) / Download Doctor is used to strip off the trailing padding. You probably could just load the file into TEXTPRO and just back over the trailing bytes. The reason to always use a copy of the file is in case of the rare instances where the file actually ends with the CONTROL-Z character. In that case, you don't want to back up all of the way. Bob Puff's SUPERARC was the program that finally saved everyone from the task of manually having to strip off the pad bytes. (Please correct me if I am wrong. In any event, that is what I remember about ".XMO" extenders....)

5907. Strange Power Supplies

Newsgroup: comp.sys.atari.8bit
Date: 1994-10-25 10:12:18 UTC
From: belitz@genesis.informatik.rwth-aachen.de
Message-ID: <belitz.72.000A34CD@genesis.informatik.rwth-aachen.de>
Source record: 97854

Hallo !!!

Yesterday I bought some original ATARI power supplies. I thougt, these are 1050-like but they are totally different !!!

Technical Data Input: AC/240 V/50 Hz/38 VA
Output I: AC/29 V/600 mA
Output II: AC/8.6V/ 1 A

As the power-plug looks, they are British ones.

The other plugs aren`t round as the 1050 or 1010 ones, but little female boxes, one with three connectors, one with two.

Now my question ?
What are these power supplies for ?
Could I use it to drive an Atari 800 (how many Amps does it need, will it work with 8.6 V) ?

Matt

5908. [--- .lha files? ---]

Newsgroup: comp.sys.atari.8bit

Speaking of file extenders... one of the ATARI computer clubs with ftp and e-mail access was kind enough to e-mail me the patch for the ATARI XF551 drive when I posted of my trouble with the copy in the ATARI Archive. Thank you! Thank you! Thank you! Thank you! The file has a strange compression extender on it. It is ".LHA" . This UNIX systems' COMPRESS and GUNZIP utilities do not recognize this extender. SUPERARC does not recognize this extender either. What would I have to do to convert an ".LHA" file into an 8-bit ".ARC" format suitable for an ATARI 6502 ?

5909. Re: HELP needed with 810 alignment!

Before aligning it, I would try cleaning the head with a Qtip and head
cleaner.
I had trouble with a used disk drive that I bought for a Wang computer.
I thought there was something wrong with the drive. Someone told me to
clean the head. I did and the problem went away. I cleaned it with a Qtip
and cleaner the first time & now use a cleaning disk once a month.
I haven't had any problems since.

Not this one, but I've seen Atari equipment in other movies:
"Sneakers" features a guest appearance by the original Atari acoustic modem (can't remember the number now...)
and "Being from another Planet," a 1980's film which I saw on Mystery Science Theater 3000, features an Atari XL series computer masquerading as the security computer for a university building.

Try LHARC, a PD MS-DOS program. I don't remember if it uses .LHA or
.LZH for the extender, but it might work.
Or I think there may be an ST program that makes files with .LHA
extender, but I don't know anything about it.

From: REASERRL@POST2.LAAFB.AF.MIL
Message-ID: <2EAC042F@POST0.LAAFB.AF.MIL>
Source record: 97769

I talked with Jim Hood today (Sunday, 23 Oct) and he said that they mailed the first issue of the New Atari Classics last night. It went out first class, so you should be receiving it shortly. The magazine is 44 pages long. It was sent to just under 150 people. It includes an 8 page ad from B&C. There is no masthead, no letters to the editor or editor's comments since they didn't have time to get those things done and the length was already there. They hope to have that stuff in the next issue.

Jim asked me where The October/November issue of Current Notes was as well. I called Joe Waters (our publisher) today and he said the magazines are in the mail and should be at your doorstep shortly (second class). CN is 84 pages this issue. 8-bit articles include a piece by Frank Walters on using TextPRO as an offline reader. We have Bill Kendrick's piece on digitized sound programs. There is also a review of the Swift Calc spreadsheet program. Then there is my monthly column. The next issue will be out mid-December, but he's going to label it as Jan/Feb 95. This won't change your subscription or anything. you'll get the proper number of issues. The

hope is that this will get CN on a better cycle.

As usual, I'm always on the lookout for 8-bit writers for CN.

Source record: 97780

Hi!

Anybody used the MULE for transfering files between the IBM and
the Atari?
If you are used the MULE because your 1050 don't like the double
density, and you found that MULE isn't work or you have some idea for
what should have in MULE, or you want to know how it work, then write
to me.
I working on MULE because I've only 1050 and 810 and both hate
the double density. MULE is able to transfer 45824 bytes but if the
file is bigger then it will transfered in blocks of 45056 bytes. You
don't have to label the disks because MULE will know the file's name
and the file's length.
Ok, anybody interested in?

In a previous article, mrathwel@uoguelph.ca (Mark Rathwell) says:

>Has anyone out there ever tried the DIAMOND GEM graphic operating
>cartridge? I'm interested in it, but I'd like to know more about it's
>pros and cons. Also ... what are the Diamond Paint and Diamond Write
>programs like? Thanks,

I have Diamond GOS 2.0. I found it interesting, but a little buggy and
annoyingly incompatible with most programs I tried to run under it.

I thought Diamond Paint was basically boring. Write only came with release
3.0 (the final release) so I've never seen it. GOS 3.0 in general I
suppose might have been more usable than the version I have.

One bother I recall is that once I went from the SDX prompt to
the Diamond desktop, I couldn't get back again, I was stuck in Diamond.
Ick. It also seemed to have problems with SpartaDOS-style verbose
directories, even though it was trying to support them.

I don't know, maybe I'll dig out my Diamond GOS cart again and refresh my
memory. If you can get it cheap, especially 3.0, I say sure, give it a
whirl. But for me, running SpartaDOS X without Diamond has been more
enjoyable than when I tried to run them together. And I really like the
power of SDX.

Oh, of course. And neither the Sol or the IMSAI had any real graphics ability, which made the maps and chess game in the movie a bit ridiculous, to say the least. But then this is a movie where all of the printers have 8.5 inch carriages, and yet all the printouts are on wide carriage paper....

Wasn't there also some movie about a robot kid brother which had extended sequences of him kicking butt in Pole Position on a 1200XL or something?

Hehehe, I thought I was the only person quick enough on the uptake to notice that it was 6502 code. Heck, I was quick-eyed enough even when I first saw Terminator in the THEATRE, to notice that... and to note that the program being displayed was something called "Super Key 4.0," whatever that is. I've always meant to try to look it up... I _didn't_ spot the comments about VTOC etc., though.

>There's an article on one of the first Mega
>Magazines containing the sources. :-)

Does the article pre- or post-date the movie? I.e. is the article specifically ABOUT "the program listign which appears in Terminator," or did the listing come first and the movie later? And if the latter, is this where the makers of Terminator actually GOT the listing for use in the movie? Either way I'd like to see it; where does one OBTAIN this "Mega Magazine?"

You are quite right in selecting the software as the bottleneck here;
SIO2PC runs on the PC, and of course won't run on the Amiga (though I
am moved to wonder, "what about under one of the several PC emulators?
Does 'IBeM' handle serial I/O yet? And what if you have a Bridgeboard
in that 2000 of yours?"). The last I heard, someone was working on
"SIO2Amiga" software which, if/when perfected, would allow the Amiga
to interoperate with the SIO2PC hardware, but it was far from finished
and I haven't heard a peep out of that project in most of a year now.
If I knew more about hardware I'd consider tackling it myself, but I
don't even have an SIO2PC unit to mess with at present.

>Please tell me your expiriences.

My experience has focused on a variety of solutions. Briefly:

1) Null-modem serial file-transfer. Connect a null-modem cable between
the Amiga's serial port and whatever you're using for RS232 on your
Atari, run appropriate terminal-emulation and file-transfer software
on both, and exchange files 'til your eyes fall out. :-) I run
Kermit and XMODEM at 9600 baud all the time.

2) Use third-party disk formats acessible to both. There is software for
a PC with 360K 5.25" floppy drives to copy disk files back and forth
between MSDOS and Atari double-density "MyDOS" floppies, and software
for an Amiga to read and write MSDOS on either 3.5" or 5.25" floppies.
You could use these two pieces of software, and a PC with a 3.5" and
a 5.25" floppy drive, to transfer files in a roundabout manner:
Amiga <--> PC <--> Atari. The hard part is finding a PC with the
right combination of floppy drives.

Hope this helps,

Chris Chiesa

WANTED INFOCOM GAMES

Wishing to purchase the following original INFOCOM games
MUST have ALL original packaging and be in good condition

Any computer format

Seastalker
Sorcerer
Wishbringer
Deadline

Zork Trilogy
Enchanter Trilogy
Classic Mystery Library
Science Fiction Classics

Also interested in early Infocom games i.e the ones with the wierd
packages such as

Deadline police folder in 302x256x3 pouch
Suspended 240x317x70 box with recessed white face mask
The Witness police folder in 302x256x3 pouch
Infidel 235x304x8 folder in form of writing case
Sorcerer 308x239x12 box
Seastalker 238x300x7 folder

ALso looking for Infocomics such as

Lane Mastodon vs. The Blubbermen
Gamma Force in Pit of a Thousand Screams
ZorkQuest: Assault on Egreth Castle
ZorkQuest II: The Crystal of Doom

Willing sellers please e-mail details for negotiation

THanks

Keith Stewart

And why did the (original) article take so long to arrive here in the first
place- it's dated 14 October, but It's just popped up here as a new post,
and I've read c.s.a.8 many times since then....

the mind boggles

Hmmm.. I've just seen something elsewhere that set me thinking. Is this
something to do with Fidonet? See Re: Stereo-Audio-Data (reads it again)
Aha! My suspicions were correct- someone has managed to link Fidonet and
Internet (funnily enough, I was wondering why someone hadn't done that when
I was reading an article about Fidonet the other day). But it still doesn't
explain what the heck is happening....
Hey!- does this mean I can send people Fidonet messages even though I'm not
on Fidonet?
'Nuff drivel- how about some answers?

Double your Freezer capacity- defrost it today!!!

What about Sneakers, where the guys use an Atari 815 Acoustic Modem to do thier hacking! Hey, and Liesure Suit Larry 5 (?) has an Atari Computer in it (400 I believe). Maybe we should try and compile a list of movies which show Atari Hardware. Oh, of course we have T2: Judgement Day where the Folio is used to bust the ATM and the labs security system.

Howdy Folks,

I live in Germany and want to order a MIO-II-Board for
the special Price, I know, $79.

Would anybody of you know, how I can get one of the Boards?

I think(hope), that anybody in the USA could order it
to itself at home and then send it to me in Box as an
GIFT.

I can pay the price by MasterCard, or how you want.

The Gift is only for paying not the toll for electronical
things in export. It should not be an real Gift, only
written on top of the box. So it will be cheaper.

There was a discussion about this in alt.folklore.computers a few months
back and somebody said it was Apple][code not Atari code. VTOC is also
common to the Apple. There was also some COBOL thrown in somewhere.

5948. Atari Software for Sale

Newsgroup: comp.sys.atari.8bit
Date: 1994-10-26 22:20:16 UTC
From: Doug Finch <76337.1067@CompuServe.COM>
Message-ID: <38mkn1$2r7$1@mhade.production.compuserve.com>
Source record: 97718

ATARI SOFTWARE FOR SALE
I bought several boxes of Atari software (and a few non-Atari items) at an auction in which a retailer's inventory was liquidated. As I result I have surplus items which I would like to sell immediately. All of these are unused, unopened, factory-fresh, in original boxes. All 8-bit items will work on 400/800, XL and XE machines, all of the games are cartridges; productivity items on 5.25" diskettes. All ST software is on 3.5" diskettes.
The games and programs are, for the most part, vintage but nonetheless entertaining, playable and/or educational. I'd just like to see that they get into the hands of folks who can put them to use.
As for shipping, I will send to USA locations via non-priority U.S. mail or UPS delivery. Buyers outside the US should enclose an additional $2 (US) per item for shipment via surface mail). Best to contact me by E-mail if you're unsure about anything. Here's what I have:

SOFTWARE PRICE (Incl. US shipping)
8-bit Games:
Defender (CXL 4025) = $4
Asteroids (CXL 4013) $4
Joust (RX 8044) $4
Qix (CXL 4027) $4
Star Raiders (still the greatest!) (CXL 4011) $4
Sky Writer (educational) (RX 8059) $4
Music Composer (educational) (CXL 4007) $4

8-bit Productivity:
AtariWriter Plus (powerful 8-bit word processor w/spellchecker incl., on disk) (AX 2034) = $7.50
Home Filing Mng. (file card sys.) (CX415) $4
Master Diskette (DOS 2.0 w/manual and explanation of 810 disk drive, commands) (CX8104) $7.50

ST Games:
Missile Command (arcade classic) (DS 5018) = $4
Battle Zone (tank shootout) (DS 5020) $4

ST Productivity:
Haba/How to Write Professional
Business Letters (boilerplate specials) = $5

NON-ATARI ITEMS FOR SALE (All are unused)

SOFTWARE PRICE (Incl. US shipping)
For Apple II,IIe,IIc:

Silent Service (Microprose) = $8
Winner of various adventure & simulation awards

For Commodore 64:

WordPro 3 Plus/64 (Professional Software Inc) = $5
Word processor with spellchecking module

HARDWARE
For IBM compatibles:

JT Fax 9600 daughter board (JTFAX96D) = $10

Drop me a note via E-mail to make sure I've still got what you're looking for and for my mailing address. When I confirm I've got your item(s), and your check or money order clears, I'll ship immediately. If anything doesn't work, I'll replace it or refund your money, provided you pay for reshipment. Bonus program included (my choice, you specify 8-bit or ST) while supplies last. Enjoy your Atari!

5949. MASSIVE AUCTION IV -- update #5 (includes Atari 8-bit)

Newsgroup: comp.sys.atari.8bit
Date: 1994-10-26 22:50:30 UTC
From: dw901@cleveland.Freenet.Edu
Message-ID: <38mmfn$aa7@usenet.INS.CWRU.Edu>
Source record: 97717

MASSIVE AUCTION IV -- UPDATE #5:

Games and/or game systems included in this auction are:

ATARI 2600 ATARI 5200 ATARI 7800 ATARI LYNX
ATARI 8-bit games ATARI computers COLECOVISION COMMODORE 64
INTELLIVISION ODYSSEY2 PONG (VARIOUS) TOMY TUTOR
SEGA MASTER SYSTEM TEXAS INSTRUMENTS TRS-80 COLOR COMPUTER VECTREX

****

This is a rather large file, if you don't like large files, and/or auctions,
please stop reading now. You have been warned!

I will post updates approximately every 24 hours, and delete the last update
after I'm sure the new one is up. I will also e-mail the list to all bidders,
and anyone who request's it.

Mike

Due to problems with my local system, I was unable to e-mail/post updates or
receieve e-mail over the past weekend. To compensate for this, I am
extending the deadline for the auction by 2 days, until Friday at 11:59 p.m.

****

PLEASE READ THE AUCTION RULES AT LEAST ONCE BEFORE PLACING BIDS.

NOTE: I will use the first part of your E-mail address when listing bids.

****

AUCTION RULES:
1) THE DEADLINE FOR BIDDING IS 11:59 P.M. EST, ON FRIDAY, OCTOBER 28TH.

2) MINIMUM BIDS ARE LISTED FOR EACH ITEM UP FOR AUCTION, MINIMUM INCREMENTS
ARE $0.50 ON GAMES AND $1.00 ON SYSTEMS.

3) BUYER PAYS ALL SHIPPING COSTS.

4) NO PACKAGE DEALS ON GAMES OR SYSTEMS.

5) TRADE OFFERS WILL BE ENTERTAINED, BUT CASH OFFERS ARE GIVEN PRIORITY
(UNLESS THE TRADE OFFER INCLUDES VECTREX GAMES OR SYSTEMS!).

6) EVERYTHING IS SOLD AS IS. UNLESS SPECIFIED, ALL GAMES AND SYSTEMS HAVE
BEEN TESTED AND ARE IN WORKING ORDER.

7) IN CASE OF TIES, FIRST BID RECEIVED WINS.

8) IF YOU ARE THE HIGH BIDDER ON AN ITEM, YOU ARE EXPECTED TO BUY THAT
ITEM. DON'T PLACE A BID UNLESS YOU ARE PREPARED TO BUY WHAT YOU BID ON.

9) IF YOU DON'T FOLLOW THROUGH ON A BID, YOU WON'T BE ABLE TO PARTICIPATE
IN FUTURE AUCTIONS.

10) PAYMENT MUST BE MADE IN U.S. FUNDS, DRAWN FROM A U.S. BANK BRANCH.

NOTE: ALL CARTRIDGES ARE LOOSE (IE. WITHOUT BOX AND MANUAL), UNLESS SPECIFIED.

*****

SOFTWARE:

TRADE = trade pending, bids still accepted in case trade not made.

HARDWARE:

NOTE FOR THOSE BIDDING ON SYSTEMS: If you are the high bidder on certain
systems (they are marked) you will have the option of buying a brand new RF
switchbox for $5 that is virtually identical to one sold at Radio Shack for $7.
It allows for the connection of both 300 OHM and 75 OHM antenna lead-in's.

If you already have an RF switchbox, most systems will work fine with it. Some
systems still include one, please read carefully. I just ran out of used RF
switchbox's in the last MASSIVE AUCTION, sorry.

LOT #1 - THERE ARE 3 OF THESE SYSTEMS AVAILABLE, THE TOP 3 BIDS ARE LISTED.

NEW RF SWITCHBOX PURCHASE OPTION

ATARI 2600 SYSTEM (4-SWITCH DESIGN), WITH TWO (2) ATARI JOYSTICKS, ONE SET OF TWO PADDLE CONTROLLERS, POWER SUPPLY, AND SIX (6) GAMES [NO BOXES, OR MANUALS FOR GAMES]:

ASTEROIDS (Atari)
BREAKOUT (Atari)
COMBAT (Atari)
HOME RUN (Atari)
SPACE INVADERS (Atari)
SWORDQUEST: EARTHWORLD (Atari)

THESE ARE COMPLETE ATARI 2600 SYSTEMS, EXCEPT FOR RF SWITCHBOX.

BID #1) MINIMUM OPENING BID OF $25.00
BID #2) MINIMUM OPENING BID OF $25.00
BID #3) MINIMUM OPENING BID OF $25.00

*****

LOT #2 - THERE ARE 3 OF THESE SYSTEMS AVAILABLE, THE TOP 3 BIDS ARE LISTED.

NEW RF SWITCHBOX PURCHASE OPTION

ATARI 2600 SYSTEM (4-SWITCH DESIGN), WITH TWO (2) ATARI JOYSTICKS, POWER SUPPLY, AND SIX (6) GAMES [NO BOXES, OR MANUALS FOR GAMES, EXCEPT ASTEROIDS HAS MANUAL]:

ASTEROIDS (Atari) [WITH ORIGINAL MANUAL]
COMBAT (Atari)
DONKEY KONG (Coleco)
MISSILE COMMAND (Atari)
PAC-MAN (Atari)
SPACE INVADERS (Atari)

THESE ARE COMPLETE ATARI 2600 SYSTEMS, EXCEPT FOR RF SWITCHBOX.

BID #1) MINIMUM OPENING BID OF $25.00
BID #2) MINIMUM OPENING BID OF $25.00
BID #3) MINIMUM OPENING BID OF $25.00

*****

LOT #3

NEW RF SWITCHBOX PURCHASE OPTION

SEARS TELE-GAMES (ATARI 2600 COMPATIBLE SYSTEM) WITH BOX, MANUAL, TWO (2) ATARI JOYSTICKS, ONE SET OF TWO PADDLE CONTROLLERS, POWER SUPPLY, AND TEN (10) TELE-GAMES CARTRIDGES [NO BOXES, OR MANUALS FOR GAMES]:

BOWLING (Tele-Games)
BREAKAWAY IV (Tele-Games)
FOOTBALL (Tele-Games)
GOLF (Tele-Games)
MISSILE COMMAND (Tele-Games)
PAC-MAN (Tele-Games)
PONG SPORTS (Tele-Games)
SPACE INVADERS (Tele-Games)
TANK-PLUS (Tele-Games)
TARGET FUN (Tele-Games)

THIS IS A COMPLETE ATARI 2600 COMPATIBLE SYSTEM, EXCEPT FOR RF SWITCHBOX.

THE BOX AND MANUAL AREN'T IN GOOD SHAPE, BUT BOTH ARE INTACT.

MINIMUM OPENING BID OF $60.00

5950. Re: connecting amiga-XL

Newsgroup: comp.sys.atari.8bit
Date: 1994-10-27 00:32:47 UTC
From: krishna@max.tiac.net
Message-ID: <38msff$gbj@sundog.tiac.net>
Source record: 97721

Jeff M Lodoen (jlodoen@shell.portal.com) wrote:
: And it needs a reliable connect speed of 19.2K bps, or 38.4 for
: Ultraspeed. If an emulator could handle that (?) it _might_ work.

A bridgeboard is about as much of an Amiga as an ATR-8000 is an Atari.

PCTASK is the most popular MS-DOS emulator for the Amiga, and it requires a huge amount of CPU power to acheive modest performance.

"Odaman" from Japan tried it and it would run SIO2PC but the software could not find the serial port I believe.

Even if it could, one must understand how the serial port works on the Amiga. It requires a lot of CPU power to drive the stock serial port. Under emulation, available CPU cycles would already be straining. Getting 57K data rate out of them would be next to impossible. On a slotted Amiga like the 2, 3, or 4000 and using a replacement serial card, that might be possible.

It would be better to write something Amiga-specific, and using a better port. I think the floppy port might work. The parallel port might as well. There is something called PARNET for the Amiga, but the handshaking is next to nil on that.

5951. I'm looking for an 800XL

Newsgroup: comp.sys.atari.8bit
Date: 1994-10-27 01:24:52 UTC
From: geodog@interaccess.com
Message-ID: <geodog.4.007B1F39@interaccess.com>
Source record: 97725

If anyone knows of, or is selling an Atari 800XL please email me a notice:
geodog@interaccess.com.

I'd be very interested in also knowing of any other extra equipment available.
For instance off the top of my head I know I would like to get a 1050 disk
drive. For what I wouldnt know!? J/K

Once a long time Atari user now turned afficiando - I'd like to enjoy the
knowledge I once gained. As a loyal fan of Atari products I'd like to revive
my old collection of software. I have the software - it's just I no longer
have any hardware!!

Please, any and all responses are appreciated. Thank you.

There was a realy awful TV show in the early 80s called "Wiz Kids" that featured Atari machines.....

Also, I distinctly remember Alan Alda doing ads for the Atari XL line, but it *seems* like I remember some TV commercials circa the '83 holiday season featuring him as well. Does anyone else remember this?

- Scott (Atari fanatic since '78!)

Hi!
Im the proud owner of a 5200 mint in box, w/ a RARE 2600 cartridge adapter!
Has anyone ever seen this? I can play 2600 carts on my 5200. Any one have
any 5200 carts in box to sell?

by the way, i know the 7800 coulld play 2600 carts, right? does the 2600 play
7800 carts?

thanx,

curt

It's not exactly Atari 8-bit computers, but many of us started out with the old Atari 2600 game machine. Anyway, in the Oct 15th issue of Datamation, the following paragraph appeared.

They tried it with Classic coke, so why not Classic Atari Games? That's the big idea at Activision, which said recently that it will reintroduce for PCs popular Atari 2600 video games it sold back in the 1980's. The games will be available in two compilations, each running under Windows, for about $29.95 each on floppy disk or CD-ROM. The first compilation, slated to be introduced in February 1995, will include 10 to 15 of the most popular Activision 2600 titles, including "Pitfall," "Kaboom!", "River Raid," and "Chopper Command."

5959. Connecting ATARI and AMIGA

Newsgroup: comp.sys.atari.8bit

Source record: 97732

Hi.

I tried several time, and I hope it will be help for you.

I have Amiga1200. And I have PC emulator called "PC-Task". It is
software only emulator, so I can it only.

I made sio2pc hardware and I tested it on *true* PC. It worked
well. Then I tried sio2pc on AMIGA with PC-Task. It seems run well
at first, but IT DOESN'T WORK!!

I tried on accelerated(A1200 030/50mhz with 4megFAST) too, but it
doesn't work well too.

On the A2000, there are some emulator require hardware board. I
think sio2pc can run well on such hardware products. But I think
i80286 or i8086 PC clones are much cheaper than such hardwares and
sio2pc can work on i8086/10mhz!! To tell the truth, I baught cheap
PC for sio2pc, and it has i8086/10mhz. There is no probrem, I am
using ATARI with very fun.

OK, it is my reports of Amiga + PC-Task. It doesn't work, it is RESULT.
bye!!

Hi, all!

I am planning to use SpartaDos on my Atari130xe. I watched there
are some files in UMICH:8bit/Spartados, but there is not *.dcm file.

What must I get from UMICH to use SpartaDOS??

If it is FAQ, I'm sorry. But I don't find FAQ about files of
SpartaDOS...
Please let me know about it by E-mail "odaman@pfu.fujitsu.co.jp".

Thanks!!

From: F Tooned <ftooned@delphi.com>
Message-ID: <hw90K-x.ftooned@delphi.com>
Source record: 97731

Hi everyone,

The phone #'s are correct. Our PCB design house has had to do a quickturn on some boards for Quantum and Seagate... and has pushed the release date for the MIO II's back until the first part of Dec. I promise it will be ready for Christmas!!

FTe is also releasing a 65816 upgrade for the XL and XE series of machines called the "Sweet 16" Board. Projected price will be $69.95 and it has been fully tested with the MIO's and Black Box. (and the MIO II's for that matter)

FTe has decided to turn distribution of our classic ICD/OSS/Newell products over to B&C ComputerVisions at 408-986-9960. We will still be taking direct phone orders for the MIO II's, MARS 8, and Sweet 16 boards, as they will only be available from us.(at least in the US)

I've been going through the mailing list this week, and plan on getting a flyer out to everyone who has requested info. Thanks to everyone for their support!! The next few months are gonna be a doozy. Mike

Heh. I'll buy; just wish there were digital joysticks on MS-DOS
machines to give the proper feel.

What I'd like to see is, maybe for the twentieth anniversery or
something, Atari rereleasing the 2600 as a "limited edition collectors item"
along with games. Advertise squarely at adults, see how many will go for it.

5963. MULE the file transfer utility. The 'How it works?' session 1(?)

Newsgroup: comp.sys.atari.8bit
Date: 1994-10-27 17:11:57 UTC
From: HEGEDUS@mszi.pmmf.hu
Message-ID: <18B549C63C4@mszi.pmmf.hu>
Source record: 97737

Hi!

So many people wrote to me so I think I'll send this thing to the
newsgroup.
You know (if you tried to use MULE you may be know but if you
didn't use so you know by now) MULE using 180k disks formatted under
MSDOS.
Take a look at this disk:
- it's single side and double density disk
- it has 40 track
- 9 sector/track
- 512 bytes/sector
The Atari use this format:
- single side and enhanced density disk : 130k
- 40 track
- 26 sector/track
- 128 bytes/sector
What do think? They're not use the same format, but if we tried
to read only the first 9 sector on both track then the Atari 1050
will read that. It will read very slow but it will read something. But
those bytes not the same as on the PC side was. We have to XOR them
with 255. Why? I don't know...
/*Here is some sector reading time:
Atari DOS disk: 4 (or 15 if there was track change)
No disk: 9 (disk was removed)
Bad disk: >50 (bad sectors...)
MULE disk: 44 (the right sectors only!)*/
Oh yes, the new MULE using two drives now on Atari side because
I've got 1050 & 810. The 1050 reads the MULE disk and the 810 write
the Atari DOS file), but I'll make an other version for single drive
(not single density! it works only on the 1050).
Tom Bene asked me: Why 45824 bytes ?
Yes I know the old MULE works with 24k(? or 32k) but I remove
this limit because:
1 disk = 360 sector
- 2 sector for file name and length
= 358 sector = 358*128 = 45824 bytes
On Atari side I read one sector and write to the file, so it
isn't require so much memory as the old MULE require. But if I make
the single drive version it will take 1 (or two if I'll lamer or
lazy) pass to transfer the file (45824 bytes have to fit into the
64k!).
Now on the Atari side I use Turbo Basic. I know it's slower than
assembly but I haven't any time for make it in assembly. On PC side I

use Borland C++ 2.0.
I know it's not very complicated for first sight but you'll think
this idea is very stupid for the second sight. (and you has right!)

Ok, that's it... any question?

Bye!

Tomika

5965. MASSIVE AUCTION IV -- update #6 (includes Atari 8-bit)

Newsgroup: comp.sys.atari.8bit
Date: 1994-10-27 18:33:12 UTC
From: dw901@cleveland.Freenet.Edu
Message-ID: <38orp8$etk@usenet.INS.CWRU.Edu>
Source record: 97738

MASSIVE AUCTION IV -- UPDATE #6 (36 hours left):

Games and/or game systems included in this auction are:

ATARI 2600 ATARI 5200 ATARI 7800 ATARI LYNX
ATARI 8-bit games ATARI computers COLECOVISION COMMODORE 64
INTELLIVISION ODYSSEY2 PONG (VARIOUS) TOMY TUTOR
SEGA MASTER SYSTEM TEXAS INSTRUMENTS TRS-80 COLOR COMPUTER VECTREX

****

This is a rather large file, if you don't like large files, and/or auctions,
please stop reading now. You have been warned!

I will post updates approximately every 24 hours, and delete the last update
after I'm sure the new one is up. I will also e-mail the list to all bidders,
and anyone who request's it.

Mike

Due to problems with my local system, I was unable to e-mail/post updates or
receieve e-mail over the past weekend. To compensate for this, I am
extending the deadline for the auction by 2 days, until Friday at 11:59 p.m.

****

PLEASE READ THE AUCTION RULES AT LEAST ONCE BEFORE PLACING BIDS.

NOTE: I will use the first part of your E-mail address when listing bids.

****

AUCTION RULES:
1) THE DEADLINE FOR BIDDING IS 11:59 P.M. EST, ON FRIDAY, OCTOBER 28TH.

2) MINIMUM BIDS ARE LISTED FOR EACH ITEM UP FOR AUCTION, MINIMUM INCREMENTS
ARE $0.50 ON GAMES AND $1.00 ON SYSTEMS.

3) BUYER PAYS ALL SHIPPING COSTS.

4) NO PACKAGE DEALS ON GAMES OR SYSTEMS.

5) TRADE OFFERS WILL BE ENTERTAINED, BUT CASH OFFERS ARE GIVEN PRIORITY
(UNLESS THE TRADE OFFER INCLUDES VECTREX GAMES OR SYSTEMS!).

6) EVERYTHING IS SOLD AS IS. UNLESS SPECIFIED, ALL GAMES AND SYSTEMS HAVE
BEEN TESTED AND ARE IN WORKING ORDER.

7) IN CASE OF TIES, FIRST BID RECEIVED WINS.

8) IF YOU ARE THE HIGH BIDDER ON AN ITEM, YOU ARE EXPECTED TO BUY THAT
ITEM. DON'T PLACE A BID UNLESS YOU ARE PREPARED TO BUY WHAT YOU BID ON.

9) IF YOU DON'T FOLLOW THROUGH ON A BID, YOU WON'T BE ABLE TO PARTICIPATE
IN FUTURE AUCTIONS.

10) PAYMENT MUST BE MADE IN U.S. FUNDS, DRAWN FROM A U.S. BANK BRANCH.

NOTE: ALL CARTRIDGES ARE LOOSE (IE. WITHOUT BOX AND MANUAL), UNLESS SPECIFIED.

*****

SOFTWARE:

TRADE = trade pending, bids still accepted in case trade not made.

****

HARDWARE:

NOTE FOR THOSE BIDDING ON SYSTEMS: If you are the high bidder on certain
systems (they are marked) you will have the option of buying a brand new RF
switchbox for $5 that is virtually identical to one sold at Radio Shack for $7.
It allows for the connection of both 300 OHM and 75 OHM antenna lead-in's.

If you already have an RF switchbox, most systems will work fine with it. Some
systems still include one, please read carefully. I just ran out of used RF
switchbox's in the last MASSIVE AUCTION, sorry.

LOT #1 - THERE ARE 3 OF THESE SYSTEMS AVAILABLE, THE TOP 3 BIDS ARE LISTED.

NEW RF SWITCHBOX PURCHASE OPTION

ATARI 2600 SYSTEM (4-SWITCH DESIGN), WITH TWO (2) ATARI JOYSTICKS, ONE SET OF TWO PADDLE CONTROLLERS, POWER SUPPLY, AND SIX (6) GAMES [NO BOXES, OR MANUALS FOR GAMES]:

ASTEROIDS (Atari)
BREAKOUT (Atari)
COMBAT (Atari)
HOME RUN (Atari)
SPACE INVADERS (Atari)

: something, Atari rereleasing the 2600 as a "limited edition collectors item"
: along with games. Advertise squarely at adults, see how many will go for it.

Yeah.!! Make it light grey or even white or something...
of course they will probably just dump out the jr with "limited edition"
slapped on it. =)

How about doing the original 6 switch one again..

5969. Looking for Atari 2600 cartridge list

Newsgroup: comp.sys.atari.8bit
Date: 1994-10-28 15:52:27 UTC
From: ekman@lysator.liu.se
Message-ID: <EKMAN.94Oct28165228@ruben.lysator.liu.se>
Source record: 97743

I have been trying to get in touch with the mailserver that has all the classic video game cartridge lists for quite some time now, but with no success. If anyone happens to have the 2600.lst on-line, could you please mail it to me? It doesn't necessarily have to be a very recent version.

Thanks in advance

/Fredrik Ekman

5970. Re: Using a 1.44 meg with CSS xf upgrade

Newsgroup: comp.sys.atari.8bit

Hello
I am using a 1.44 MB Teac drive (3.5")
it is connected with the HDI from Erhard Puetz (Germany) and works fine...
It is possible to connect up to 4 drives to the HDI.

5972. MASSIVE AUCTION IV -- last update (13 hours left)

Newsgroup: comp.sys.atari.8bit
Date: 1994-10-28 16:46:16 UTC
From: dw901@cleveland.Freenet.Edu
Message-ID: <38r9so$qnr@usenet.INS.CWRU.Edu>
Source record: 97745

MASSIVE AUCTION IV -- UPDATE #7 (13 hours left):

Games and/or game systems included in this auction are:

ATARI 2600 ATARI 5200 ATARI 7800 ATARI LYNX
ATARI 8-bit games ATARI computers COLECOVISION COMMODORE 64
INTELLIVISION ODYSSEY2 PONG (VARIOUS) TOMY TUTOR
SEGA MASTER SYSTEM TEXAS INSTRUMENTS TRS-80 COLOR COMPUTER VECTREX

****

This is a rather large file, if you don't like large files, and/or auctions,
please stop reading now. You have been warned!

I will post updates approximately every 24 hours, and delete the last update
after I'm sure the new one is up. I will also e-mail the list to all bidders,
and anyone who request's it.

Mike

Due to problems with my local system, I was unable to e-mail/post updates or
receieve e-mail over the past weekend. To compensate for this, I am
extending the deadline for the auction by 2 days, until Friday at 11:59 p.m.

****

PLEASE READ THE AUCTION RULES AT LEAST ONCE BEFORE PLACING BIDS.

NOTE: I will use the first part of your E-mail address when listing bids.

****

AUCTION RULES:
1) THE DEADLINE FOR BIDDING IS 11:59 P.M. EST, ON FRIDAY, OCTOBER 28TH.

2) MINIMUM BIDS ARE LISTED FOR EACH ITEM UP FOR AUCTION, MINIMUM INCREMENTS
ARE $0.50 ON GAMES AND $1.00 ON SYSTEMS.

3) BUYER PAYS ALL SHIPPING COSTS.

4) NO PACKAGE DEALS ON GAMES OR SYSTEMS.

5) TRADE OFFERS WILL BE ENTERTAINED, BUT CASH OFFERS ARE GIVEN PRIORITY
(UNLESS THE TRADE OFFER INCLUDES VECTREX GAMES OR SYSTEMS!).

6) EVERYTHING IS SOLD AS IS. UNLESS SPECIFIED, ALL GAMES AND SYSTEMS HAVE
BEEN TESTED AND ARE IN WORKING ORDER.

7) IN CASE OF TIES, FIRST BID RECEIVED WINS.

8) IF YOU ARE THE HIGH BIDDER ON AN ITEM, YOU ARE EXPECTED TO BUY THAT
ITEM. DON'T PLACE A BID UNLESS YOU ARE PREPARED TO BUY WHAT YOU BID ON.

9) IF YOU DON'T FOLLOW THROUGH ON A BID, YOU WON'T BE ABLE TO PARTICIPATE
IN FUTURE AUCTIONS.

10) PAYMENT MUST BE MADE IN U.S. FUNDS, DRAWN FROM A U.S. BANK BRANCH.

NOTE: ALL CARTRIDGES ARE LOOSE (IE. WITHOUT BOX AND MANUAL), UNLESS SPECIFIED.

*****

SOFTWARE:

TRADE = trade pending, bids still accepted in case trade not made.

HARDWARE:

NOTE FOR THOSE BIDDING ON SYSTEMS: If you are the high bidder on certain
systems (they are marked) you will have the option of buying a brand new RF
switchbox for $5 that is virtually identical to one sold at Radio Shack for $7.
It allows for the connection of both 300 OHM and 75 OHM antenna lead-in's.

If you already have an RF switchbox, most systems will work fine with it. Some systems still include one, please read carefully. I just ran out of used RF switchbox's in the last MASSIVE AUCTION, sorry.

LOT #1 - THERE ARE 3 OF THESE SYSTEMS AVAILABLE, THE TOP 3 BIDS ARE LISTED.

NEW RF SWITCHBOX PURCHASE OPTION

ATARI 2600 SYSTEM (4-SWITCH DESIGN), WITH TWO (2) ATARI JOYSTICKS, ONE SET OF TWO PADDLE CONTROLLERS, POWER SUPPLY, AND SIX (6) GAMES [NO BOXES, OR MANUALS FOR GAMES]:

ASTEROIDS (Atari)
BREAKOUT (Atari)
COMBAT (Atari)
HOME RUN (Atari)
SPACE INVADERS (Atari)
SWORDQUEST: EARTHWORLD (Atari)

THESE ARE COMPLETE ATARI 2600 SYSTEMS, EXCEPT FOR RF SWITCHBOX.

BID #1) $25.00 jtuer
BID #2) MINIMUM OPENING BID OF $25.00
BID #3) MINIMUM OPENING BID OF $25.00

*****

LOT #2 - THERE ARE 3 OF THESE SYSTEMS AVAILABLE, THE TOP 3 BIDS ARE LISTED.

NEW RF SWITCHBOX PURCHASE OPTION

ATARI 2600 SYSTEM (4-SWITCH DESIGN), WITH TWO (2) ATARI JOYSTICKS, POWER SUPPLY, AND SIX (6) GAMES [NO BOXES, OR MANUALS FOR GAMES, EXCEPT ASTEROIDS HAS MANUAL]:

ASTEROIDS (Atari) [WITH ORIGINAL MANUAL]
COMBAT (Atari)
DONKEY KONG (Coleco)
MISSILE COMMAND (Atari)
PAC-MAN (Atari)
SPACE INVADERS (Atari)

THESE ARE COMPLETE ATARI 2600 SYSTEMS, EXCEPT FOR RF SWITCHBOX.

VTOC is not necessarily a pointer that the inspiration for that Terminator
was Atari. VTOC was a buzzword in the days of IBM mainframes.

I haven't used Mule, but I HAVE used MYDOSPC (Utils), it also only works
in double density mode. It's pretty impressive and includes the C source code.

I experienced the same thing, GOS is pretty unforgiving and there are more
than a few cold boots required to get OS loaded back in. Good concept
though if you are only going to run BASIC. Anything else and it is 50/50
whether the machine will hang.

The author of Atari's DOS was also the author of Apple's DOS. Since Bill
Wilkinson wrote both programs, this would explain the similarity in names.

>There was a realy awful TV show in the early 80s called "Wiz Kids" that

Yes, Alda touted the wonders of the 800 XL, the Atari Writer cartridge,
and the Touch Tablet if I recall correctly.

Speeking of the gods of the 8-bit Universe, what is Mr. Wilkinson working
on these days?

Hi Bob, the controller is called an MIO (Multi I/O), a new version is
being manufactured by a company called Fine Tuned Engineering (FTE), one
of the members of the XE Group picked up 5 of them. The current cost is
$80 US. This is a limited time price. I don't have the Internet address
for the company, but if you like I'll hunt around for it.

Yep! there is still stuff being made by third party sources. I also heard
a rumour that Atari compatable floppy drives were being manufactured in
Germany, but have not yet had anything to treat this that other than a rumour.

He is no god. He was never particularly faithful to the Atari platform.
As soon as something came along that tickled his fancy he ditched the
Atari and moved on. His intro to Mapping the XL/XE hints towards his
attitude.

Rod McCall (rmccall@mcs.dundee.ac.uk) wrote:
: How many 8-bits were sold?

: Also when did production start and end?

I'm not sure how many were sold, but likely several million. The 400 and 800 first came out in 1978, followed by the 1200XL, 800XL, and 600XL in the early 80's. When Atari was purchaced by the Tramiels, the older models were discontinued and then replaced in 1985 with the 130XE (my favorite) and the 65XE. In 1987, Atari tried to boost the struggling 65XE by repackaging it as the XE game system. Cool looking unit and a neat idea, but it didn't catch on because console fans thought it was a computer and computer fans thought it was a console. I had one for a while. Having a detached keyboard was neat!

Not sure when the 8 bits were discontinued, but in 1992, Atari finally admitted that the 8 bits and the 2600 and 7800 systems were no longer being produced. I think they kept making small quantities for markets in Europe and South America, while ignoring everywhere else. I kinda wish I still had my computer(s). I have a pile of software for them.

From: Doug Finch <76337.1067@CompuServe.COM>
Message-ID: <38sm4r$gu2$1@mhadg.production.compuserve.com>
Source record: 97860

ATARI SOFTWARE FOR SALE
Thanks to your swift response, I'm SOLD OUT out of Asteroids cartridges for Atari 8-bit computers. However I still have a good supply of surplus items purchased at auction. All are unused, unopened, factory-fresh, in original boxes. All 8-bit items will work on 400/800, XL and XE machines, all of the games are cartridges; productivity items on 5.25" diskettes. All ST software is on 3.5" diskettes. SHIPPING TO THE U.S. IS INCLUDED IN THE PRICE.
The games and programs are, for the most part, vintage but very entertaining, playable and/or educational. As for shipping, U.S. buyers can expect non-priority U.S. mail or UPS delivery. Buyers outside the U.S. should enclose an additional $2 (US) per item for shipment via surface mail). Contact me by E-mail for more information. Here's what I have:

SOFTWARE PRICE (Incl. US shipping)
8-bit Games:
Defender (CXL 4025) = $4 Star Raiders (CXL 4011) = $4
Joust (RX 8044) $4 Sky Writer (RX 8059) $4
Qix (CXL 4027) $4 Music Composer (CXL 4007) $4
8-bit Productivity:
AtariWriter Plus (incl. spellchecker) (AX 2034) = $7.50
Home Filing Mng.(CX415) = $4 DOS 2.0 (w/tutorial) (CX8104) = $7.50

Also -- For the ST: Atari's Missile Command, Battle Zone, $4 each; Haba/How to Write Professional Business Letters, $5. Ask about other Silent Service for Apple II,IIe,IIc; WordPro 3 Plus for Commodore 64 and goodies for IBM compatibles. Drop me a note via E-mail to make sure I've still got what you're looking for and for my mailing address. When I confirm I've got your item(s), and your check or money order clears, I'll ship immediately. If anything doesn't work, I'll replace it or refund your money, provided you pay for reshipment. Bonus program included (my choice, you specify 8-bit or ST) while supplies last. Will consider reasonable swaps. Enjoy your Atari! DF

Vince,

The pleasure is all mine. It's YOU guys that really make the new
products happen. I really hope to get the needed feedback from your
group, to make this a "first class" fourth generation product.

Glenn,

The 816 will be a simple microprocessor replacment. (plug and play)
Yes, Virtual Support IS possible, and will be made available after
I get some boards out to "beta-test"... The only problem I can see
is that there are A LOT of people who don't have a clue as to what
the '816 is truely capable of. (It's like getting a new computer,
at least from a programmers standpoint.)

Hello Is there something like a FAQ for programmers ?
Maybe we can put informations about the 6502 and Antik instructions in it
maybe some more infos about PM, interrupts,.....
Somebody here who will do the coordination ?
Somebody here who has text files about this similar the
mapping the atari or some else.
What do you think about my idea....

>>the Hercules-Card yet, because I don't own a TLL Hercules monitor.
>
>I want it! Then I could use the cheaper 'internal' modems with my
>Atari.

You could use the modems provided they don't need too much of the ISA signals.
The ISA-Slot adapter supports only the folowing:

data (A0-A15), address (A0-A19), IOR/W, MEMR/W, +5V, GND

(we are speaking of ISA - PC signals here).

If your modem needs some sort of an external clock signal it won't work
without modifications.

You can get the interface from:

Roland Buehler
Engelgasse 21
D-72348 Rosenfeld-Bickelsberg
Germnay
Tel.: +49-(0)7428-1260

Here's what it costs:

Schematics + handler-software on disk: 10DM (about $7.50)
PC Hercules card: 15DM (about $10)
ready (plug & play) ISA<->Atari-8bit interface card: 35DM (about $23)
connector interface card<->cartridge port/PBI: 5DM (about $3)

These prices include shipping within Germany. There may be additional
shipping costs abroad.

>I wonder how hard it would be to hack up one of those interfaces
>anyway. I haven't been able to find much info about ISA tech specs.

Not very hard actually, but you'll need some software handlers for it.
They are still under development, but at least the Hercules card works
fine with it.

You could order just the schematics + handlers if you want and build it
for yourself.

In a previous article, KVVP@MARISTB.MARIST.EDU ("Hutnik, Richard") says:

>Help me... I would like to get some software for this machine.
>Also, anyone know if anyone is still writing stuff for it?

Sure! There's LOTS of stuff still being developed for the 8-bit. A new company called Fine Tooned Engineering just came out(they bought out another company called ICD). They sell really useful stuff like RS232 interfaces so that you can hook up really fast modems to your 8-bit, stick a hard drive on it so you can save space in your computer room(like me...I have about 400 odd 5.25" disks lying around...most are backups of backups). They just recently released the MIO2 which will allow you to hook up an IDE hard drive to your 8-bit.

There is another company on the other coast called CSS(Computer Softare Services) run and owned by Bob Puff, creator of BobTerm, UnArc, SuperArc and Disk Communicator. He has several 8-bit upgrades such as a 5.25" to 3.5" 1.44meg drive for the XF551. There is also a lot of software by him to allow backups of original disks. He also has a network system called 'The Multiplexer' that you can order that will allow you to network your 8-bits together.

There's my $0.02!

If Atari had the money, they could rule the world...I'm not kidding!
They really could! If they re-opened their ST and 030 and possibly even
the 8-bit lines and did a bit more advertising, they would be at the top!

Glen or Mike,

I'm a programmer with a background in Dbase IV/Clipper (also GEAC ZOPL, COBOL, FORTRAN....stone age stuff like that ;))
Anyway, I'd like to write some utilities for the 8-bit, but don't know the best language to use (I'd like to avoid assembler). I'm playing around with ACE C, but it has too many limitations to be effective. For instance, it does not support multi-dimensional arrays, etc...

Can you suggest a language that is still available (PD/Shareware) if possible, that will be equally efficient to create code for telecommunications and other applications that will talk to hardware devices. If there is a shareware option, I'll send in a licensing fee.

For instance, writing a memory manager would be a fun thing to hack around with. Heck, if it is possible in the IBM world, where the architecture has been pushed beyond its original specifications, it would be neat to take a shot at doing the same thing for the Atari. Especially when there is a meg or two to play with on the new improved 8-bit.

Regards,

Vince Grienti

Well, without a new 16-bit DOS, and only a couple 802/816 modified programs, and without linear RAM or some way to make it work at a higher clock speed, yes, it would not have much use to an end-user.

Therefore the issues that remain to be resolved about where the 816 is going to go relate directly to those things which must occur on it to make it give the platform immediate advantages:

faster (dual?) clock speed
24-bit memory slots
updated operating system and a move to hack programs to work better/faster with the 816.

But I won't pry this info out of you, and will wait for this info to arrive in due time.

:by the way, i know the 7800 coulld play 2600 carts, right? does the 2600 play
: 7800 carts?

Not a chance. The 7800 has a unique cart slot in that 2600 games
will fit into it, as will 7800 cartridges. 7800 cartridges won't even fit
into the 2600. Besides, the 7800 is a LOT more powerful than the 2600 and
make use of many features which the 2600 couldn't handle. The graphics
are better, there can be more on-screen colors, the 7800 has more memory,
larger games, two button joysticks, a pause button, greater sprite
capability: It's about the same power as the Nintendo Entertainment System.

Hey Winston, I sent you this file.
I put it on my Amiga 4000 and compressed it with lha-uue-encode.
at first, uue-decode it
at second decode it with lha (now you have an dcm-file)
at third move it to the XL (I use 0 modem cable)
and now decode it on the xl with diskcommunicator
thats all

From: kamaro_kid@delphi.com
Message-ID: <5G40T2d.kamaro_kid@delphi.com>
Source record: 97875

A while back, somebody posted a list of Fido based BBS'S where the 8bit atari feed could be found. Can somebody please repost that?

I USED to access the FlightLine, but lost the number -- and the last time I was on, they had switched to a new .ARC format which was incompatible with SpartaDos X and SuperUnarc.

Lharc.exe should decompress .LZH and .LHA formats - or at least I've been
succesful at doing such.

: make use of many features which the 2600 couldn't handle. The graphics
: are better, there can be more on-screen colors, the 7800 has more memory,
: larger games, two button joysticks, a pause button, greater sprite
: capability: It's about the same power as the Nintendo Entertainment System.

It's graphics chip actually runs at 7.56mhz I think. It has fast memory
to support the Maria chip. The NES I think only runs at around the Atari
8-bit clock speed level. The SNES only runs at 3.56mhz. The speed of
the GFX chip makes a big difference in how many sprites it can throw up
and how fast it can do animation and scrolling. You can tell it is more
powerful than the NES in some areas by checking out games like Tower
Toppler. The undersea sequence uses parallax scrolling and looks to me
like a Genesis game, let alone an 8-bit NES.

Many of the 7800 games did not push the envelope of the Maria chip and
therefore gave a false impression of its capabilities.

Current Notes has been running a "series" of Diamond GOS articles by Kevin Packard that show one how to do various things with that product. I have Diamond myself. The paint program is fairly nice. The word processor (Write) pretty much sucks IMHO. I don't think it was ever really finished. The basic desktop is functional, but an occasional weirdness does pop up. I used the product with SDX. The mouse interface is pretty clean.

Since MAC/65 is now owned by Fine Tooned Engineering, best thing to do is
to ask FTe how they feel about it. Perhaps Mike will see this and respond.

A friend of mine over in Ireland has designed and built a cable that hooks up between his Atari and Amiga 1200. The details are going to be released on the next issue of the Phoenix disk newsletter (no. 3). I've begun to collect the parts for it and the basic design is similar to the SIO2PC in that it uses a MAX232CPE chip. The only other items required are four capacitors, a resistor or two and a 74LS126 chip. In all, it costs about stlg5 to build the actual interface board plus the SIO and RS-232 cables.

The article in Phoenix is going to show how to connect it to either a 25-way RS-232 connector or a PC RS-232 connector (can't remember if the PC uses a 15-way or 9-way connector). The cable can therefore be used to hook up the Atari to an Amiga, PC or ST (which is why I'm building one).

After you build one of these interfaces, all you then need is suitable comms software for the two machines you've hooked up. I suspect that if you have an SIO2PC cable, you can transfer files to the PC in a similar way.

Hope that helps anyone.

Vince, you may want to look at CC65 which is a fairly good
& complete 'C for the Atari. It's the old style compiler
where you have to edit your source code, exit, compile, exit,
link, exit, execute. It takes quite a while to build a program
this way, but it does have features like structures & unions.
Personally, I've only used those features once in my life for
a C class I took so I don't require them. My language of choice
is Action! because it seems to run about 70% of the speed of
assembly language, but now that I'm familiar with the language I
can get programs done at least 10X quicker then assembly.
Action! does support records & the manual lists an example of
a company employee list for reference. The only downsides I've heard
about Action! is lack of direct floating point access & built in
banking access to 130xe memory. It's not really a problem for me
since I know how to do both, but the info sources you need are not
readily available. A tortuous path to learning the language, find out
what you want to do, find out you don't know how to do it, find out
the manual doesn't explain it, ask here or on the FTE bbs & hope
someone gets back to you.
There's really nothing you can't do in Action!, but finding out
how can be a problem.
Rick

6022. Received New Atari Classics

I got my New Atari Classics yesterday. Contrary to my last post, it had a short "Letters to the Editor" section. (Slight miscommunication between me and Jim Hood.)
Lots of great ads in the thing from places I've never heard of (or thought were dead). Overall, I think the magazine looks good. Some good diagrams and clip art as well as a half-tone photo on the cover. There were a few items that were ancient history, but that was probably due to the publishing

delay. Jim said he thought that now that they'd done one, they have sort of

a routine so the next issue will come out quicker--like mid to late December.

Anybody know when the AC disk is supposed to come out? I forgot to ask Jim Hood about that.

I got my prerelease copies of the Oct/Nov issue of Current Notes (Green cover with pink letters this month.). Everyone else should be getting their

copies in a few days. There was one error in our Table of Contents. Frank Walters preview of TextPRO 5.2 was in the last issue. (Ah, the wonders of word processing--some things never go away.)

AtariWriter is the cartridge based WP. AtariWriter+ is on disk and
includes mail-merge and spell-checking.

APX sold an add-on program called "ATSpeller for AtariWriter" which
may be exactly what you need. I've never seen or used it, anybody
else?

I see it listed in a B&C ComputerVisions catalog, $7 each for
APX disks. $4 each for 10 or more.

A US copyright supposedly lasts the life of the author plus 50
years. (I assume the same deal holds for a corporation).

But use of copyrighted material is only "illegal" if the
copyright owner files a claim against you for violating it.

So if you have permission from copyright holder or intend "fair
use" of copyrighted material (IE: no personal gain) it's not a
problem (especially if copyrighted material is so dated that it
no longer serves any practical or profitable use to copyright
holder).

I've thought about this issue in terms of old software, circa
early 1980's, whose publishers are long since out of business,
but whose copyrights on software still technically exists.
Ethically speaking, is it "piracy" to copy old software when
its owners are no longer using the copyright for purposes of
enterprise? How can you be sued for lost profits if the company
no longer exists, etc. etc. Same deal probably holds whereby
you get permission from author to release software into public
domain (I know of a few programs for the Apple II line that
have gone from copyrighted to public domain like that). Just a
thought...
